CHP is still on VHF-Low but they do use VHF-High for Mobile Repeaters.
I'm sure quite a few have cell phones as well.

I wish you luck. There isn't much out there (if anything- including used) that you'll find covering the military band for under $100.

Hopefully someone else will be of more help. :-)

I saw something to that effect on CNN a day or so ago. The following
is from the CNN web page, searching for Blue Angels:

-May 29, 1996

-Web posted at: 1 a.m. EDT

-First African-American to head Blue Angels steps down

-WASHINGTON (CNN) -- The first African-American to head the Navy's
-Blue Angels precision flying team stepped down Tuesday, saying his
-flying was not up to the team's high standards, according to a
-statement from the Navy.

-Cmdr. Donnie Cochran, who became commanding officer of the U.S.
-Navy's flight demonstration squadron in 1994, cited personal training
-problems as his reason for leaving the team, the Navy said.

-Cochran flew with the Blue Angels at Friday's graduation services for
-midshipmen at the U.S. Naval Academy in Annapolis. The next three
-scheduled performances of the Blue Angels will have to be canceled
-because of Cochran's departure.

(End of quote)

Also, the same search revealed an article from Oct. '95 where the team
returned to the practice fields around Pensacola because he (CDR

Cochran) had problems flying.

Don't know what will happen beyond the next three. The Navy sure isn't having a good PR year, and that's a pity - the Blues have always been my favorites.

I know this could VOID the warranty.... but if there is such a law in which it only allows a minimum of volume and you feel it's ridiculiously high, why not open it up and modify the box with a potentiometer or however you do it to get the desired volume level you want. They mostly send out a high frequency tone and high frequency get out a lot more....verses lower frequency tones. The range is much higher with high frequency tones.

I recently found myself in Exton PA for a weekend and just happen to have had my BC200 with me. I had the chance to listen a little but since it's unusual for me to be in that area I have no reference material to help me know what I was hearing.

Here is a list of the most active frequencies. Can anyone tell me what they were?

154.785
154.310
155.760
154.815
154.740
155.445

So they are selling them with no receiver board for $80.00. Not to bad but how much is the receiver board, $900. Is the receiver board just a set of plug in connectors or is there major soldering, and then I suppose you have to have it recalabrated.

I'd like to see programs that run in DOS on a XT class PC like my
palmtop. I was quite unhappy with Scancat's user interface and would
like something more useful. But if it's not portable (as I am!), it's
not worth much to me.

>why would anyone want a base only model? Any comments?

Basically (no pun intended), the base scanner makes it easier to add an external antenna (and not have the unit flopping around all over as a handheld is want to do). It also will have better audio and generally (IMHO) better performance due to the fact that it need not be crammed into such a tiny space.

Other than that, not much difference that I can think of.

Friends,

It's still available. The IBM/DOS Broadcasting Radio Station Database Program for Longwave, Mediumwave, and Shortwave. Over 4,000 records included already. The program is completely read and write with all restraints turned off! This program will run forever!

If you would like a copy send your Snail Mail address (POstal Address):

Name
Address
City etc

Also send your Email address and the program will be sent back to you with return Email..

Your address will be kep confidential! I MAY possibly send you a first class letter sometime down the road describing my other Radio programs, but that is all.....

Hope to hear from you

I have an MVT7100 for sale.

3 sets of batteries
1 Radio Shack 2 hour rapid charger
Case
Charger/Power cube
Short stubby 800MHz antenna
Stock antenna(collapsable whip).

The radio has a scuff in the upper left and right corners. This is the exposed area by the case strap. It if from only being in a case with alot of equipment and it was brushed up against while in this case. Otherwise the radio is fine.

Reason for selling is it has 1000 channels and at best I have less than 20 in it right now. I have another one I use more often so it is not needed.

Price is $500.00 including shipping

email: nc1l@esslink.com

Message-ID: <31B0EAD0.4837@earthlink.net>
Source record: 232599

Does anyone out there know what frequency the LoJack car alarm is allocated? I copied a digital burst signal during a search in the area of the upper VHF federal allocations, between 172 and 174MHz. If anyone has located the freq., please E-Mail me. I'd like to see if I was on-the-mark with my search of bandwidth. I do know that a six-digit code was being repetitively transmitted every 20 - 30 seconds (or so it seemed), with a weaker burst being copied every 5 to 10 seconds (maybe the trigger transmission). Thanks.

Doug

Neil Soane <nsoane@pavilion.co.uk> asked:
> ... what this "information zulu" or "zulu" or "pupa" actually is.

Most controlled airports have a specific frequency (called ATIS -
Automatic Terminal Information Service) which broadcasts a tape loop with
the current conditions & status, i.e. weather, active runways, hazards, etc.
It is periodicly updated, with each new recording during the day given the
next phonetic designator.
An approaching pilot will check the ATIS and note the significant data.
When he contacts the controller, he indicates that he's heard the advisory,
specifying it's designator ("... with Juliet ..."). The controller knows he
doesn't have to give that information or, conversely, that anything more
recent than 'information Juliet' should be relayed.

Do not forget the Radio Shack PRO-26. It is full coverage with the
exception of the cell frequencies. You can order a FULL COVERAGE
PRO-26 from Javiaton in the U.K. for the same or less than you
would pay at the Radio Shack down the street.

As an aircraft approaches an airport they tune into a specific frequency to get advance weather and airport information. (landing runways, closed taxiways etc.) In the U.S., we refer to this info. as the ATIS (Pronounced AYTIS) or Automated Terminal Information System. This is a RECORDED broadcast that is made once each hour as a minimum or more often as conditions dictate. Each time a new ATIS is recorded, they change the phonetic name of that information. The name is changed in case the pilot checks on the frequency with info. PAPA but the information has since changed and become QUEBEC. This keeps everybody on the same page and tells the controllers the pilot has the most up to date information concerning the airport of intended landing.

** more written on the OS456 and was wondering, for $100 more, is
** the OS456 worth the difference.
**
** Tom

They are similar in that they allow computer control of the PRO200x series radios. The OS456 plugs in to existing connectors, and requires no soldering. The CE232 does require some soldering and chip pulling, but is not all that bad.

Operationally the biggest difference is that the CE232 will allow you to upload and download channels to the radio for use when the computer is not connectedc, while the OS456 will not. That means that you can load a specific channel plan before a trip, and throw the radio in the car, and when you return, you can UL a totally different channel plan. The OS456 will not allow you to do this.

The CE232 is available installed in your radio for an additional charge, I believe. If you are really afraid of the soldering iron, then the OS456 will be better. If you are competent with soldering small components, then the CE232 may be better.

> phonetic often is different, but I have no idea what this "information
> zulu" or "zulu" or "pupa" actually is.

'Information xxxx' refers to the information that's given over the ATIS.
Listen to the Gatwick ATIS frequency (128.475 I think) and you will hear
them say something like "On first contact with Gatwick contact Gatwick
Approach xxx.xxx with Information xxxx". From memory, they say the
'letter' of the information (i.e. Zulu) at the beginning of the
recording. The ATIS simply gives info about the weather, QNH etc. I
guarantee that after you've listened to the ATIS, you'll understand what
I mean.

: What keypad entry for the cell bands for the PRO2035?

You can't with just the 2035.

However, if you equip the 2035 with an OS565 computer interface for $300 plus major work on the scanner, you can enter a 20-digit unlock code thru the computer interface.

60. Sensitive Scanner for Sale -- DX!

I have a very sensitive PRO2021 I'm looking to sell. I don't know if all of them were built this way, or if this one is particularly sensitive, but I've used I can easily hear signals from Maine and Massachusettes (I'm in Arizona) by connecting it to a 1/4 wave CB ground plane on the 30-50MHz band. Who knows what it could do on a properly tuned antenna. My PRO2006 can't do this! It's in a metal case, and resists interference well. I've had better scanners, but whenever I needed to really HEAR something, I always turned to this one.

It's old, but in great condition and works fine. 200 channels + 10 monitor channels. 30-54MHz, 108-174 MHz, 380-512 MHz. Comes with a car mounting bracket.

E-mail me your best offer to:

rcyoung@ix.netcom.com

Thanks for the comments. By our measurements the typical user operating at 21,600 to 28.8 kbps loads the main page in 20 to 30 seconds; at 14.4 kbps you'll see about 45 to 60 second loads. A 14.4 modem is our target user. However, the actual load time varies depending upon server load and Internet traffic. We rent our server space at AccessOne in Kirkland WA. They connect to the Internet over two T-1 connection (1.544 mbps each).

Depending on your browser, you may be able to disable the display of graphics or ensure that your browser caches images so that they do not need to be downloaded each time. My browser also lets me page up and down and read pages before the entire page has been loaded. This let's me select things to read without necessarily waiting for the entire page to load.

We are also in process of setting up the web site on a new ISP that may have higher performance. We'll post a message when that becomes availble - probably its a month out at least.

We know that as our hobby web site has grown, the size of the pages has also grown. We've redesigned the web site twice since starting and its time for another redesign to accomodate the increased content.

We would like to do a redesign some time but that's easier said then done. We run this web site solely as a hobby. My real job typically uses up 11 hours a day of my time; we've got 3 small kids. And other time pressures too. Sometime we will change the page design again but I would not expect more than perhaps a 1/3rd reduction in download time.

Who knows what it could do on a properly tuned antenna. My PRO2006 can't do this!

I listened to the middle east war activity with my 2006 in this freq range and often pick up California Highway Patrol, Oil rigs, and many other domestic and foreign stations with the 2006 here in the midwest. I know someone that ran their 2006 for several years with the switch on the back in the '10bd att' position instead of the '0db' position. This cuts the signal strength down. He could hear local stations okay but nothing distant. I changed the switch to '0Db' and he was amazed at what he could hear. Thought of him when you said your 2006 didn't pick up these distant stations. You may have a different situation and probably know about the switch, but just in case I thought I mention it. - this memo is meant to be helpful (I realize that I risk insulting you by pointing this out and don't mean to at all. Mike was glad when I showed him on his rig because he did not know about it.) All reviews of the 2006 that I've read, by the way, do point out that the 2006 is *not* as sensitive as many other scanners. I'm sure that the 2021 will hear things that the 2006 won't. Good luck on selling the 2021. I'm sure the buyer will like the extra sensitivity!

Happy Scanning,

Mac

Unless I'm confusing this with another POCSAG decoder (and I don't think I am), it requires a 286, not an XT. This was a major point in my not buying it, since I want to use in on an HP Palmtop. Please advise!

>so you can drive and operate it and listen to it in a reasonable way.
>I'd be afraid to leave the thing just sitting around because it could go
>flying around during a sudden stop.

I have a '94 Camry that has a few things against it for radio installations. First, the dash and like areas have a very porous vinyl, so adhesives are out. Also, it's leased and I don't want any problems with removing the adhesives. Second, the area between the seats is completely filled with the heat/air, gearshift, and center storage box (again, topped with the same vinyl). So in the center was out. I didn't want to pursue glass mount for a few reasons -- location and safety. I have yet to see a suction cup that will reliably hold any substatial weight for very long. I ruled out cup holders due to the fact that operating/seeing the AR8000/Scout was inconvienient in the window area. I had not seen vent mounts, but since the radio would likely face directly to the rear (without modification), I suspect the AR8000 would be rough to see from that angle.

What I finally did was to mount a Sony gooseneck (from an old car CD mount) on the passenger side of the center console (about 3 inches to the left of where most passenger's left knee sits). On top of that, I mounted a metal project box from Radio Shack. I folded down the lip on one of the longer sides of the cover of the box so that the belt clips for both units would fit in. (Actually, the Scout's required some clipping/bending to the other half as well..) I positioned the box so that it is at a 45 degree angle to the front/rear of the car and is facing me. It is also looking up at a slight angle. The antenna leads are wire-tied to the gooseneck so that they are readily available when it comes time to install them. I also have power adapters that plug into the lighter socket for power (so that at night I can leave the AR8000's backlight on full time and not worry about the battery).

The next addition? The broadcast bandpass filter. Those FM stations kill me.

If it's not too clear to anyone what I did, please let me know and I will clarify.

I don't see why. Their local oscillators shouldn't pose a problem.
However, if you can provide the frequencies, perhaps someone can do
an analysis based on the IFs of the units. Also, are they Minitors,
or Minitor II's?

What you see is the Digital Music Express system. This is the Muzac of the 90's. The reason you can't pick anything up is because the way the signal is encoded. Apparantly, you have to have just the right antennae and all of the music is encoded on one or two bandwidths. That's why a receiver box is required for reception. At least that's what the company told me when I got the system for my bar.

Hello all,

Thank you to all those who have visited my website since it opened
in January this year. There have been over 2400 visits!

http://www.ibmpcug.co.uk/~g4sgi/

The site has these exciting radio related features:

SWL working aids: Foreign Language Recognition, Modulation,
Propagation and International Bandplan. These working aids are
available on-line or for download in Windows help file format.
Invaluable for the beginner and experienced alike.

List of UK MW and VHF stations: This text file contains a complete
list of broadcast stations in the British Isles.

PC-MONITOR v4.03 free for download: This DOS program controls the
FRG8800 and FRG9600 radios. Available completely free.

FRG100 Sprite demo: Information on this Windows control program
for the FRG100 together with a free demo version.

MUFsight demo: Information on this HF Propagation predicition
Windows program which uses the MINIMUF algorithm to plot
propagation information on a world map. Download a demo free.

Information on AOR control software: Includes information and demos
of Searchlight (for the AR3000A), Concerto (for the AR3030),
PC-MANAGER (for the AR8000/AR2700), Hawk (for the SDU5000).

NEW! Information on new AOR software for the AR3030/AR7030:
Combines a Visual dBase application with new high performance
control software. Plot transmitter data on a world map and tune
using a point and click interface. Available soon.

Links to other radio related sites: Including broadcast stations,
major radio retailers/dealers/manufactuers, organisations, other
personal pages.

There is something there for everyone. Why not visit.

81. Crystal question??

Newsgroup: rec.radio.scanner
Date: 1996-06-02 00:00:00 UTC
From: Doug Luckey <104564.3125@CompuServe.COM>
Message-ID: <4osjaq$7f$1@mhafc.production.compuserve.com>
Source record: 232500

This question is for all of you oldtimers out there. I am not a big scanner buff but I came upon a Sears solid state 10 channel crystal scanner at a garage sale for $7, so I bought it because the price seemed right.

Anyway my question is this. It has the original crystals in there and a few of them are still picking up local stuff but I want to get some crystals for current frequencies in my town (Portland, Oregon). Are these still available on the market and if so are they available for my scanner? I read somewhere that Radio shack still can order these but I am not sure where to start. PLEASE HELP!

If you have any suggestions you can email me or reply directly to this message. I will check back in a day or two.

Thanks,
DL

After evaluating all the popular scanning software I went with the Probe which I think is the best scanning software out there. It has all the features I was looking for, it is very fast in terms of scanning, is easy to use, and cheaper than many of the other scanner programs. The only disadvantage depending on your point of view is it does not run in windows.

Cheers.

Paul

Source record: 232507

I bought a 2700 but two days later swopped it (and some more money) for an 8000. Reasons were:

2700 seems to have worse birdies (spurious responses) - subjective impression rather than scientific statement !

8000 has nice big dot-matrix display allowing user-friendly menu interface rather than 2700's quirky key-press sequences and hard-to-see LCD indications

8000 has some nice extra features - offset channels, alpha tags, auto store, squelch options etc

(All IMHO)

This message was originally addressed to ALL
and a carbon copy was sent to you.

If anyone from the North East (New York/Washington, DC) have any frequencies the United Nations uses, especially those in the VHF/UHF range, and from participating member's embassies/counselates, please let me know! Also included in this frequency request are any frequencies used by the New York-based Council on Foreign Relations and the Council on Foreign Relations.

To give you an idea of who the U.N. is and what nonsense they continue to propegate, the below is provided. I strongly urge everyone to read it and print it out for future reference. Feel free to investigate the below document on your own if you don't believe what it says. This is especially true for those who are citizens of Canada, because it directly affects you as well.

This also includes UN military acting under the United Nations umbrella.

I'll be tracking the 300-500 U.N. solders and frequencies used during the Olympics here in Atlanta, but any further information you may provide would be invaluable.

I will be happy to consolodate the information and provide it in one report here if anyone is interested.

Thanks in advance.

Roger

Whose Side Are They On?
by John F. McManus

In the interest of peace, many Americans have been persuaded to support disarmament programs and to create as a substitute for each nation's military a United Nations Peace Force. Most feel certain that their own rights and the independence of their nation would in no way be placed in jeopardy. But there is a vital question few seem willing or able to ask: Who would be left to restrain the all-powerful United Nations?

For his Secretaries of State and Defense, President John F. Kennedy selected Dean Rusk and Robert S. McNamara. Each was a member of the New York-based Council on Foreign Relations, a private organization formed in 1921 for the purpose of bringing about a one-world government.

Only nine months into his administration - on September 25. 1961, to be precise - Mr. Kennedy travelled to UN headquarters in New York to present a proposal entitled Freedom From War: The United States Program For General and Complete Disarmament in a Peaceful World. The work of the Rusk-led State Department, with the willing acquiescence of the McNamara-led Defense Department, the proposal was published as "Department of State Publication 7277."

In his remarks before the UN, President Kennedy asked for a commitment from all nations "not to an arms race, but to a peace race - to advance together step by step, stage by stage, until general and complete disarmament has been achieved." He did not get any such commitment, yet the United States embarked on the Kennedy-launched program.

Freedom From War (or "7277" as it was frequently called) proposes three stages of disarmament ending with the transfer of the armed forces of our nation to the United Nations. As Senator Joseph Clark of Pennsylvania approvingly reminded his colleagues in a Senate speech on March 1, 1962, this program is "the fixed, determined and approved policy of the government of the United States."

A reading of the document itself confirms that disarmament "would proceed to a point where no state would have the military power to challenge the progressively strengthened U.N. Peace Force...." In other words, the only significant military power left in the world would be the United Nations.

The provisions of the treacherous proposal would actually leave our nation defenseless before the UN, and before any other nation that didn't similarly disarm. And it would place the UN's superior military power in the hands of the UN's Undersecretary for Political and Security Council Affairs, the overseer of all UN military activity. This post, by virtue of a secret agreement concluded at the founding of the UN (an arrangement later confirmed by an astonished former UN Secretary General named Trygve Lie), has always been held by a communist. The man who holds it today, the 14th communist in succession, is Vasiliy S. Safronchuk of the Soviet Union. Unless our leaders are stopped, they will succeed in turning over our military forces to the United Nations where they will be controlled by a communist.

```

Subverting Our Sovereignty

Are our leaders really implementing this plan? Yes, they are! The Nuclear Test Ban Treaty is part of it; the treaty banning the use of outer space for nuclear weapons is part of it; the Nuclear Non-Proliferation Treaty is part of it; and so is the Intermediate Nuclear Forces (INF) treaty, signed by President Reagan and Soviet leader Gorbachev and formally ratified by the U.S. Senate in 1988.

When Freedom From War was first made public, many startled Americans tried to obtain a copy. It was quickly declared "out of print' by federal authorities. Then, it was superseded in April 1962 by a "more precise" statement of the U.S. disarmament policy in a document entitled Blueprint For the Peace Race: Outline of Basic Provisions of a treaty on General and Complete Disarmament in a Peaceful World.

Presented formally to an 18-nation UN Committee on Disarmament meeting in Geneva, the foreword to the Blueprint states that it doesn't cancel the plans given in Freedom From War. It merely "elaborates and extends the proposals of September 25," the date that Freedom From War was unveiled at UN headquarters by President Kennedy. In complete accord with Freedom From War, the Blueprint spells out its overall goal in the third of its three stages: "The Parties to the Treaty would progressively strengthen the United Nations Peace Force established in Stage II until it had sufficient armed forces and armaments so that no state could challenge it."

When questioned about the commitment of the United States to the Blueprint, A. Richard Richstein, General Council of the U.S. Arms Control and Disarmament Agency, stated in a May 11, 1982 letter that "the United States has never formally withdrawn this proposal." In January 1991, William Nary, the official historian of the Arms Control and Disarmament Agency, confirmed again that "the proposal has not been withdrawn." Mr. Nary also confirmed that "certain features of it have been incorporated into subsequent disarmament agreements."

In summary, the plan to disarm the United States in favor of an all-powerful United Nations Peace Force is unfolding. It calls for relinquishing virtually all of our nation's military forces to a UN command whose leader, by agreement between the U.S. and the USSR during the founding sessions leading to the creation of the UN, will always be a communist. In the end, "no state could challenge" the communist-led military power of the United Nations.

This supposed "disarmament" program, therefore, is not as much about weapons elimination as it is about weapons distribution and control. If the program succeeds, only the UN and those nations skirting UN weapons prohibitions will be armed. It is remarkably similar to the drive that would outlaw private ownership of firearms. If that drive should ever succeed, only the government and those who are outlaws would possess guns. Law-abiding citizens would be at their mercy in the latter case; law-abiding nations would be at the mercy of the UN and outlaw nations in the other.

Background To This Situation

How did we get into such a situation? Who are the individuals promoting such a suicidal proposal? Why is Congress going along instead of repudiating this dangerous program? How do we get out of it before it's too late?

At the founding of the United Nations in 1945, the delegation from the United States included a young State Department official named Alger Hiss. Widely acclaimed for both his ability and his enthusiasm for the world organization, he rose to become the acting secretary general of the founding UN conference. As a member of the steering and executive committees of the conference, he played a major role in drafting the UN Charter. He also helped to staff the U.S. delegation and was chosen by his peers for the prestigious task of personally transporting the Charter to the President and to the Senate for ratification.

Alger Hiss, however, was later found to have been a secret communist, more loyal to a foreign power than to the nation of his birth. A 1950 State Department document named 15 other key U.S.

balanced steps. The reduction shall be accomplished in each step by transfers to depots supervised by the IDO of vehicles that are in excess of levels agreed upon for each step. At specified periods during the Stage I reduction process, the vehicles that have been placed under supervision of the IDO shall be destroyed or converted to peaceful uses.

(b) Production of agreed categories of strategic nuclear weapons delivery vehicles and agreed types of weapons designed to counter such vehicles shall be discontinued or limited.

(c) Testing of agreed categories of strategic nuclear weapons delivery vehicles and agreed types of weapons designed to counter such vehicles shall be limited or halted.

E. To Promote the Peaceful Use of Outer Space:

(a) The placing into orbit or stationing in outer space of weapons capable c,f producing mass destruction shall be prohibited.

(b) States shall give advance notification to participating states and to the IDO of launchings of space vehicles and missiles, together with the track of the vehicle.

F. To Reduce the Risks of War by Accident, Miscalculation, and Surprise Attack:

(a) States shall give advance notification to the participating states and to the IDO of major military movements and maneuvers, on a scale as may be agreed, which might give rise to misinterpretation or cause alarm and induce countermeasures. The notification shall include the geographic areas to be used and the nature, scale and time span of the event.

(b) There shall be established observation posts at such locations as major ports, railway centers, motor highways, and air bases to report on concentrations and movements of military forces.

(c) There shall also be established such additional inspection arrangements to reduce the danger of surprise attack as may be agreed.

(d) An international commission shall be established immediately within the IDO to examine and make recommendations

on the possibility of further measures to reduce the risks of nuclear war by accident, miscalculation, or failure of communication.

G. To Keep the Peace:

(a) States shall reaffirm their obligations under the U.N. Charter to refrain from the threat or use of any type of armed force including nuclear, conventional, or CBR - contrary to the principles of the U.N. Charter.

(b) States shall agree to refrain from indirect aggression and subversion against any country.

(c) States shall use all appropriate processes for the peaceful settlement of disputes and shall seek within the United Nations further arrangements for the peaceful settlement of international disputes and for the codification and progressive development of international law.

(d) States shall develop arrangements in Stage I for the establishment in Stage II of a U.N. Peace Force.

(e) A U.N. peace observation group shall be staffed with a standing cadre of observers who could be dispatched to investigate any situation which might constitute a threat to or breach of the peace

STAGE II

A. International Disarmament Organization:

The powers and responsibilities of the IDO shall be progressively enlarged in order to give it the capabilities to verify the measures undertaken in Stage II.

B. To Further Reduce Armed Forces and Armaments:

(a) Levels of forces for the U.S., U.S.S.R., and other militarily significant states shall be further reduced by substantial amounts to agreed levels in equitable and balanced steps.

(b) Levels of armaments of prescribed types shall be further reduced by equitable and balanced steps. The reduction shall be accomplished by transfers of armaments to depots supervised by the IDO. When, at specified periods during the Stage II

the news media is led by a CFR member. Any senator or representative who wishes to receive favor from the media goes along with subverting America to internationalists goals. Any senator or representative who tries to keep our nation independent runs the risk of having the media make him seem like a lunatic.

The great majority of the American people who value their freedom and their nation's independence have to become informed and alarmed about the path down which we are being taken. There will be no change without a rising tide of indignation. And there will be no rising tide of indignation until the frightening details about the ongoing subversion of this nation have been placed in the hands of a great many more Americans.

Happily, there are reliable sources of information both about President George Bush's commitment to his "new world order" and about the Council on Foreign Relations itself. We highly recommend two books:

1. The Establishment's Man, by James J. Drummey. A tastefully written yet devastating expose of the political career of George Bush.

2. The Shadows of Power, by James Perloff. A history of the Council on Foreign Relations taken from its own papers and publications.

The enemy is within the gates of our great land. Those who would deliver our nation to a UN-controlled "new world order" have achieved great power and influence. Whether they are stopped in time is up to individuals who will read a pamphlet like this one. books like those recommended above, and a great deal more information that is available to anyone. Once informed, an American worthy of the name will work with others to throw the rascals out of office, and, in the words of George Washington, "put none but Americans" in charge of guarding this nation.

INTRODUCTION

The revolutionary development of modern weapons within a world divided by serious ideological differences has produced a crisis in human history. In order to overcome the danger of nuclear war now confronting mankind, the United States has introduced, at the Sixteenth General Assembly of the United Nations, a Program for General and Complete Disarmament in a Peaceful World.

This new program provides for the progressive reduction of the war-making capabilities of nations and the simultaneous strengthening of international institutions to settle disputes and maintain the peace. It sets forth a series of comprehensive measures which can and should be taken in order to bring about a world in which there will be freedom from war and security for all states. It is based on three principles deemed essential to the achievement of practical progress in the disarmament field:

First, there must be immediate disarmament action:

A strenuous and uninterrupted effort must be made toward the goal of general and complete disarmament; at the same time, it is important that specific measures be put into effect as soon as possible.

Second, all disarmament obligations must be subject to effective international controls:

The control organization must have the manpower, facilities, and effectiveness to assure that limitations or reductions take place as agreed. It must also be able to certify to all states that retained forces and armaments do not exceed those

(Continued from previous message)

permitted at any stage of the disarmament process.

Third, adequate peace-keeping machinery must be established:

There is an inseparable relationship between the scaling down
of national armaments on the one hand and the building up of
international peace-keeping machinery and institutions on the
other. Nations are unlikely to shed their means of
self-protection in the absence of alternative ways to safeguard
their legitimate interests. This can only be achieved through
the progressive strengthening of international institutions
under the United Nations and by creating a United Nations Peace
Force to enforce the peace as the disarmament process proceeds.

---===---

There follows a summary of the principal provisions of the
United States Program for General and Complete Disarmament in a
Peaceful World. The full text of the program is contained in an
appendix to this pamphlet.

FREEDOM FROM WAR

THE UNITED STATES PROGRAM
FOR GENERAL AND COMPLETE DISARMAMENT
IN A PEACEFUL WORLD

SUMMARY

DISARMAMENT GOAL AND OBJECTIVES

The overall goal of the United States is a free, secure, and
peaceful world of independent states adhering to common standards
of justice and international conduct and subjecting the use of
force to the rule of law; a world which has achieved general and
complete disarmament under effective international control; and a
world in which adjustment to change takes place in accordance with
the principles of the United Nations.

In order to make possible the achievement of that goal, the program
sets forth the following specific objectives toward which nations
should direct their efforts:

* The disbanding of all national armed forces and the prohibition
of their reestablishment in any form whatsoever other than
those required to preserve internal order and for contributions

to a United Nations Peace Force;

* The elimination from national arsenals of all armaments, including all weapons of mass destruction and the means for their delivery, other than those required for a United Nations Peace Force and for maintaining internal order;

* The institution of effective means for the enforcement of international agreements, for the settlement of disputes, and for the maintenance of peace in accordance with the principles of the United Nations;

* The establishment and effective operation of an International Disarmament Organization within the framework of the United Nations to insure compliance at all times with all disarmament obligations.

TASKS OF NEGOTIATING STATES

The negotiating states are called upon to develop the program into a detailed plan for general and complete disarmament and to continue their efforts without interruption until the whole program has been achieved. To this end, they are to seek the widest possible area of agreement at the earliest possible date. At the same time, and without prejudice to progress on the disarmament program, they are to seek agreement on those immediate measures that would contribute to the common security of nations and that could facilitate and form part of the total program.

GOVERNING PRINCIPLES

The program sets forth a series of general principles to guide the negotiating states in their work. These make clear that:

* As states relinquish their arms, the United Nations must be progressively strengthened in order to improve its capacity to assure international security and the peaceful settlement of disputes;

* Disarmament must proceed as rapidly as possible, until it is completed, in stages containing balanced, phased, and safeguarded measures;

* Each measure and stage should be carried out in an agreed

period of time, with transition from one stage to the next to take place as soon as all measures in the preceding stage have been carried out and verified and as soon as necessary arrangements for verification of the next stage have been made;

* Inspection and verification must establish both that nations carry out scheduled limitations or reductions and that they do not retain armed forces and armaments in excess of those permitted at any stage of the disarmament process; and

* Disarmament must take place in a manner that will not affect adversely the security of any state.

DISARMAMENT STAGES

The program provides for progressive disarmament steps to take place in three stages and for the simultaneous strengthening of international institutions.

FIRST STAGE

The first stage containS measures which would significantly reduce the capabilities of nations to wage aggressive war. Implementation of this stage would mean that:

* The nuclear threat would be reduced:

All states would have adhered to a treaty effectively prohibiting the testing of nuclear weapons.

The production of fissionable materials for use in weapons would be stopped and quantities of such materials from past production would be converted to non-weapons uses.

States owning nuclear weapons would not relinquish control of such weapons to any nation not owning them and would not transmit to any such nation information or material necessary for their manufacture.

States not owning nuclear weapons would not manufacture them or attempt to obtain control of such weapons belonging to other states.

A Commission of Experts would be established to report on the feasibility and means for the verified reduction and eventual elimination of nuclear weapons stockpiles.

* Strategic delivery vehicles would be reduced:

Strategic nuclear weapons delivery vehicles of specified categories and weapons designed to counter such vehicles would be reduced to agreed levels by equitable and balanced steps; their production would be discontinued or limited; their testing would be limited or halted.

* Arms and armed forces would be reduced:

The armed forces of the United States and the Soviet Union would be limited to 2.I million men each (with appropriate levels not exceeding that amount for other militarily significant states); levels of armaments would be correspondingly reduced and their production would be limited.

An Experts Commission would be established to examine and report on the feasibility and means of accomplishing verifiable reduction and eventual elimination of all chemical, biological and radiological weapons.

* Peaceful use of outer space would be promoted:

The placing in orbit or stationing in outer space of weapons capable of producing mass destruction would be prohibited.

States would give advance notification of space vehicle and missile launchings.

* U.N. peace-keeping powers would be strengthened:

Measures would be taken to develop and strengthen United Nations arrangementS for arbitration, for the development of international law, and for the establishment in Stage II of a permanent U.N. Peace Force.

* An International Disarmament Organization would be established for effective verification of the disarmament program:

Its functions would be expanded progressively as disarmament proceeds.

It would certify to all states that agreed reductions have

(Continued from previous message)

taken place and that retained forces and armaments do not exceed permitted levels.

It would determine the transition from one stage to the next.

* States would be committed to other measures to reduce international tension and to protect against the chance of war by accident, miscalculation, or surprise attack:

States would be committed to refrain from the threat or use of any type of armed force contrary to the principles of the U.N. Charter and to refrain from indirect aggression and subversion against any country.

A U.N. peace observation group would be available to investigate any situation which might constitute a threat to or breach of the peace.

States would be committed to give advance notice of major military movements which might cause alarm; observation posts would be established to report on concentrations and movements of military forces.

SECOND STAGE

The second stage contains a series of measures which would bring within sight a world in which there would be freedom from war. Implementation of all measures in the second stage would mean:

* Further substantial reductions in the armed forces, armaments, and military establishments of states, including strategic nuclear weapons delivery vehicles and countering weapons;

* Further development of methods for the peaceful settlement of disputes under the United Nations;

* Establishment of a permanent international peace force within the United Nations;

* Depending on the findings of an Experts Commission, a halt in the production of chemical, bacteriological and radiological weapons and a reduction of existing stocks or their conversion to peaceful uses;

* On the basis of the findings of an Experts Commission, a reduction of stocks of nuclear weapons;

* The dismantling or the conversion to peaceful uses of certain military bases and facilities wherever located; and

* The strengthening and enlargement of the International Disarmament Organization to enable it to verify the steps taken in Stage II and to determine the transition to Stage III.

THIRD STAGE

During the third stage of the program, the states of the world, building on the experience and confidence gained in successfully implementing the measures of the first two stages, would take final steps toward the goal of a world in which:

* States would retain only those forces, non-nuclear armaments, and establishments required for the purpose of maintaining internal order; they would also support and provide agreed manpower for a U.N. Peace Force.

* The U.N. Peace Force, equipped with agreed types and quantities of armaments, would be fully functioning.

* The manufacture of armaments would be prohibited except for those of agreed types and quantities to be used by the U.N. Peace Force and those required to maintain internal order. All other armaments would be destroyed or converted to peaceful purposes.

* The peace-keeping capabilities of the United Nations would be sufficiently strong and the obligations of all states under such arrangements sufficiently far-reaching as to assure peace and the just settlement of differences in a disarmed world.

APPENDIX

DECLARATION ON DISARMAMENT

THE UNITED STATES PROGRAM
FOR GENERAL AND COMPLETE DISARMAMENT
IN A PEACEFUL WORLD

(Continued from previous message)

The Nations of the world,

Conscious of the crisis in human history produced by the revolutionary development of modern weapons within a world divided by serious ideological differences;

Determined to save present and succeeding generations from the scourge of war and the dangers and burdens of the arms race and to create conditions in which all peoples can strive freely and peacefully to fulfill their basic aspirations;

Declare their goal to be: A free, secure, and peaceful world of independent states adhering to common standards of justice and international conduct and subjecting the use of force to the rule of law; a world where adjustment to change takes place in accordance with the principles of the United Nations; a world where there shall be a permanent state of general and complete disarmament under effective international control and where the resources of nations shall be devoted to man's material, cultural, and spiritual advance;

Set forth as the objectives of a program of general and complete disarmament in a peaceful world:

(a) The disbanding of all national armed forces and the prohibition of their reestablishment in any form whatsoever other than those required to preserve internal order and for contributions to a United Nations Peace Force;

(b) The elimination from national arsenals of all armaments, including all weapons of mass destruction and the means for their delivery, other than those required for a United Nations Peace Force and for maintaining internal order;

(c) The establishment and effective operation of an International Disarmament Organization within the framework of the United Nations to ensure compliance at all times with all disarmament obligations;

(d) The institution of effective means for the enforcement of international agreements, for the settlement of disputes, and for the maintenance of peace in accordance with the principles of the United Nations.

Call on the negotiating states:

(a) To develop the outline program set forth below into an agreed plan for general and complete disarmament and to continue their efforts without interruption until the whole program has been achieved;

(b) To this end to seek to attain the widest possible area of agreement at the earliest possible date;

(c) Also to seek - without prejudice to progress on the disarmament program - agreement on those immediate measures that would contribute to the common security of nations and that could facilitate and form a part of that program.

Affirm that disarmament negotiations should be guided by the following principles:

(a) Disarmament shall take place as rapidly as possible until it is completed in stages containing balanced, phased and safeguarded measures, with each measure and stage to be carried out in an agreed period of time.

(b) Compliance with all disarmament obligations shall be effectively verified from their entry into force. Verification arrangements shall be instituted progressively and in such a manner as to verify not only that agreed limitations or reductions take place but also that retained armed forces and armaments do not exceed agreed levels at any stage.

(c) Disarmament shall take place in a manner that will not affect adversely the security of any state, whether or not a party to an international agreement or treaty.

(d) As states relinquish their arms, the United Nations shall be progressively strengthened in order to improve its capacity to assure international security and the peaceful settlement of differences as well as to facilitate the development of international cooperation in common tasks for the benefit of mankind.

(e) Transition from one stage of disarmament to the next shall take place as soon as all the measures in the preceding stage have been carried out and effective verification is continuing and as soon as the arrangements that have been agreed to be necessary for the next stage have been instituted.

Agree upon the following outline program for achieving general and complete disarmament:

I own a BC320XLT with regular antenna, and can't pick up a frickin thing in my apartment (I live on the second floor). I was thinking of this:

GROVE ANT-6 HIDDEN ANTENNA draped outside balcony hooked to a GRE SUPER AMPLIFIER inside.

Is this a good combo?

Please recommend a good antenna for apartment use (obviously, I cannot climb the roof and hook up the larger antennas.

Thanks!

Source record: 232524

(Continued from previous message)

reduction process, the parties have agreed that the armaments and armed forces are at prescribed levels, the armaments in depots shall be destroyed or converted to peaceful uses.

(c) There shall be further agreed restrictions on the production of armaments.

(d) Agreed military bases and facilities wherever they are located shall be dismantled or converted to peaceful uses.

(e) Depending upon the findings of the Experts Commission on CBR weapons, the production of CBR weapons shall be halted, existing stocks progressively reduced, and the resulting excess quantities destroyed or converted to peaceful uses.

C. To Further Reduce the Nuclear Threat:

Stocks of nuclear weapons shall be progressively reduced to the minimum levels which can be agreed upon as a result of the findings of the Nuclear Experts Commission; the resulting excess of fissionable material shall be transferred to peaceful purposes.

D. To Further Reduce Strategic Nuclear Weapons Delivery Vehicles:

Further reductions in the stocks of strategic nuclear weapons delivery vehicles and agreed types of weapons designed to counter such vehicles shall be carried out in accordance with the procedure outlined in Stage I.

E. To Keep the Peace:

During Stage II, states shall develop further the peace-keeping processes of the United Nations, to the end that the United Nations can effectively in Stage III deter or suppress any threat or use of force in violation of the purposes and principles of the United Nations:

(a) States shall agree upon strengthening the structure, authority, and operation of the United Nations so as to assure that the United Nations will be able effectively to protect states against threats to or breaches of the peace.

(b) The U.N. Peace Force shall be established and progressively strengthened.

(c) States shall also agree upon further improvements and developments in rules of international conduct and in processes for peaceful settlement of disputes and differences.

STAGE III

By the time Stage II has been completed, the confidence produced through a verified disarmament program, the acceptance of rules of peaceful international behavior, and the development of strengthened international peace-keeping processes within the framework of the U.N. should have reached a point where the states of the world can move forward to Stage III. In Stage III progressive controlled disarmament and continuously developing principles and procedures of international law would proceed to a point where no state would have the military power to challenge the progressively strengthened U.N. Peace Force and all international disputes would be settled according to the agreed principles of international conduct.

The progressive steps to be taken during the final phase of the disarmament program would be directed toward the attainment of a world in which:

(a) States would retain only those forces, non-nuclear armaments, and establishments required for the purpose of maintaining internal order; they would also support and provide agreed manpower for a U.N Peace Force.

(b) The U.N. Peace Force, equipped with agreed types and quantities of armaments, would be fully functioning.

(c) The manufacture of armaments would be prohibited except for those of agreed types and quantities to be used by the U.N. Peace Force and those required to maintain internal order. All other armaments would be destroyed or converted to peaceful purposes.

(d) The peace-keeping capabilities of the United Nations would be sufficiently strong and the obligations of all states under such arrangements sufficiently far-reaching as to assure peace and the just settlement of differences in a disarmed world.

government officials who were responsible for planning the creation of the UN. They, too, were subsequently named as secret communists by official agencies.

Not only was the U.S. represented by a sizeable number of communists, our nation's delegation also contained 43 individuals who were then or soon would be members of America's leading Establishment organization, the privately-run Council on Foreign Relations. Alger Hiss himself was both a communist and a CFR member as was another U.S. member of the UN planning team, Lauchlin Currie. As communists, and as CFR members, they worked diligently to bring the world government into existence, and they labored just as hard to have the United States a part of it.

There were, of course, delegations from the USSR and the other founding nations. These were made up of communists, socialists, one-worlders, and easily manipulated starry-eyed dreamers. All were committed to world government at the expense of national sovereignty. All wanted the United Nations to be supreme. There was to be no more war as soon as the United Nations was given sufficient power, especially unchallenged military power, to keep the peace.

For the past 45 years, intense pro-UN propaganda has convinced many Americans (and many others as well) that the words "peace" and "United Nations" are virtually interchangeable. Anyone who opposes the UN risks being labelled a warmonger. Those who support the UN customarily find themselves showered with accolades.

Peace is so universally desired that almost anything seems reasonable to achieve it. Proposals to empower the UN with the world's dominant military capability have received widespread support. At first glance, the idea may seem to have some merit. A world police force formed to keep the peace. Wouldn't it be wonderful!

Suppose, however, that the unchallengeable power of the United Nations fell into the wrong hands? Suppose it ended up at the disposal of Alger Hiss and his comrades? Couldn't it be used to impose a tyranny on the rest of mankind? Wouldn't any would-be tyrant gravitate to the organization?

Even if the UN were not run by communists, socialists, and one-worlders who despise nationhood, wouldn't the awesome power we are talking about be sufficient to corrupt anyone? Who would be

able to bridle any UN leaders who had been given greater power than anyone else on earth?

Don't Discard Americanism

It can't be said too often that America is unique. Our nation began with the thunderous assertion in the Declaration of Independence that "men ... are endowed by their Creator with certain unalienable rights." According to the founding premise of this nation, rights come from God, not from government. And the Declaration then declared that governments are formed solely "to secure these rights." That's all! Secure God-given rights, not provide for wants, redistribute the wealth, or make dependent serfs out of the people.

With the marvelous foundation laid in the Declaration, the men who formed this unique and wonderful nation then wrote a Constitution whose sole purpose was to govern the government, not the people. America was expected to be a nation where the government was limited by law and the people were limited by freely accepted moral

codes such as those found in the Ten Commandments.

Nothing like America had ever existed in all history. And did this nation prosper! Millions left the old world to come here penniless - not to be cared for but to enjoy freedom and opportunity. America became the hope of the world - even for those who were not fortunate enough to live within our borders.

The United Nations, on the other hand, has no place for God. If rights don't come from God, the presumption is that they are granted by government. The UN actually fosters such a presumption, as can be discovered in its International Covenants on Human Rights. What must be understood is that a government that presumes to grant fundamental rights - which is what the UN does - is a government that can suspend them at will. If the "self-evident" truths in the Declaration of Independence are canceled or forgotten in favor of the UN's ways, all rights given us by our Creator will exist only at the pleasure of the United Nations.

The reality here is that the UN turns the entire American system on its head. To consider submitting our nation to the dictates of the anti-American, pro-communist and Godless United Nations is suicidal. Yet, this is exactly what our leaders have been working towards for several decades. Sad to say, it is perfectly obvious that this is precisely what President Bush is talking about when he repeatedly expresses his desire to create a "new world order."

Unfortunately, the desire for peace has clouded the vision of many otherwise clear-thinking Americans. Many have been persuaded to think only of the concept of "peace," but not what kind of peace. No one should ever forget that there is the peace of the grave, the peace of submission, and the communist peace that consists of no opposition to communism. Peace with justice, the goal of anyone possessing good will, is as likely under UN domination as is the chance that water will flow uphill.

Whenever thoughts such as these are brought to the attention of sensible Americans, enthusiasm for UN-style peace diminishes. "Let's keep our independence!" is a common response. "Why should we trust others to look after our well-being?" is another. But too few are aware of the dangers inherent in an all-powerful world government. And too few, therefore, have been guarding against transferring U.S. military forces and U.S. sovereignty to the United Nations.

The "New World Order"

In an exclusive interview published in the December 31, 1990 / January 7, 1991 issue of U.S. News & World Report, President Bush called for "a reinvigorated United Nations" that he hoped would bring about the "new world order." What should be reinvigorated instead are the U.S. Declaration of Independence and the Constitution.

During a January 9, 1991 press conference. Mr. Bush said that the crisis in the Middle East "has to do with a new world order [that] is only going to be enhanced if this newly activated peacekeeping function of the United Nations proves to be effective." Obviously, he considers our forces in the Middle East to have been under the UNs peacekeeping jurisdiction. And isn't it curious that this supposed "peace" organization's authority was used to start the Persian Gulf war?

Then, in his January 19,1991 speech to the nation, the President again touted the "new world order," describing it as "an order in which a credible United Nations can use its peacekeeping role to fulfill the promise and vision of the UN's founders. " He didn't remind anyone that the UN s founders were communists. socialists, one-worlders, and starry-eyed dreamers who would happily tear down the unique foundations of the United States and replace them with the UN Charter.

What To Do To Save America

Answers to some of the questions we have already raised, and to others that anyone reading this pamphlet surely must have, begin with an understanding of the grip on America held by the Council on Foreign Relations. Mr. Bush, a member of the CFR s Board of Directors as recently as 1979, can point to more than 350 CFR members currently serving as U.S. Government officials. A similar CFR dominance prevailed during the Reagan years and in several previous administrations.

Current U.S. officials holding membership in the CFR include Secretary of Defense Cheney, National Security Advisor Scowcroft, Joint Chiefs Chairman Powell, CIA Director Webster, and Deputy Secretary of State Eagleburger. Don't expect any to block further entanglement of the United States in the UN.

There are also 16 U.S. senators and a like number of U.S. representatives who hold membership in this organization. Don't expect them to protect our nation from UN domination.

Realize too, that practically every nationally important organ of

(Continued from previous message)

STAGE I

A. To Establish an International Disarmament Organization:

(a) An International Disarmament Organization (IDO) shall be established within the framework of the United Nations upon entry into force of the agreement. Its functions shall be expanded progressively as required for the effective verification of the disarmament program.

(b) The IDO shall have: (1) a General Conference of all the parties; (2) a Commission consisting of representatives of all the major powers as permanent members and certain other states on a rotating basis; and (3) an Administrator who will administer the Organization subject to the direction of the Commission and who will have the authority, staff, and finances adequate to assure effective impartial implementation of the functions of the Organization.

(c) The IDO shall: (1) ensure compliance with the obligations undertaken by verifying the execution of measures agreed upon; (2) assist the states in developing the details of agreed further verification and disarmament measures; (3) provide for the establishment of such bodies as may be necessary for working out the details of further measures provided for in the program and for such other expert study groups as may be required to give continuous study to the problems of disarmament; (4) receive reports on the progress of disarmament and verification arrangements and determine the transition from one stage to the next.

B. To Reduce Armed Forces and Armaments:

(a) Force levels shall be limited to 2.I million each for the U.S. and U.S.S.R. and to appropriate levels not exceeding 2.1 million each for all other militarily significant states. Reductions to the agreed levels will proceed by equitable, proportionate, and verified steps.

(b) Levels of armaments of prescribed types shall be reduced by equitable and balanced steps. The reductions shall be accomplished by transfers of armaments to depots supervised by the IDO. When, at specified periods during the Stage I reduction process, the states party to the agreement have agreed that the armaments and armed forces are at prescribed

levels, the armaments in depots shall be destroyed or converted to peaceful uses.

(c) The production of agreed types of armaments shall be limited.

(d) A Chemical, Biological, Radiological (CBR) Experts Commission shall be established within the IDO for the purpose of examining and reporting on the feasibility and means for accomplishing the verifiable reduction and eventual elimination of CBR weapons stockpiles and the halting of their production.

C. To Contain and Reduce the Nuclear Threat:

(a) States that have not acceded to a treaty effectively prohibiting the testing of nuclear weapons shall do so.

(b) The production of fissionable materials for use in weapons shall be stopped.

(c) Upon the cessation of production of fissionable materials for use in weapons, agreed initial quantities of fissionable materials from past production shall be transferred to non-weapons purposes.

(d) Any fissionable materials transferred between countries for peaceful uses of nuclear energy shall be subject to appropriate safeguards to be developed in agreement with the IAEA.

(e) States owning nuclear weapons shall not relinquish control of such weapons to any nation not owning them and shall not transmit to any such nation information or material necessary for their manufacture. States not owning nuclear weapons shall not manufacture such weapons, attempt to obtain control of such weapons belonging to other states, or seek or receive information or materials necessary for their manufacture.

(f) A Nuclear Experts Commission consisting of representatives of the nuclear states shall be established within the IDO for the purpose of examining and reporting on the feasibility and means for accomplishing the verified reduction and eventual elimination of nuclear weapons stockpiles.

D. To Reduce Strategic Nuclear Weapons Delivery Vehicles:

(a) Strategic nuclear weapons delivery vehicles in specified categories and agreed types of weapons designed to counter such vehicles shall be reduced to agreed levels by equitable and

For those interested in Boat racing. The US Offshore Pro Tour Admin is currently using the following Freq:

464.6625-Repeater PL-114.8

All Judges, Tour Rescue Units, & Misc Tour Officials were on this Temp repeater during the recent race in Laconia,NH on Lk.Winnipesaukee. Im not sure if they'll use this freq for every race but the radios, repeater and all comm equipt is owned by the tour. Anything in addition would be greatly appreciated. Enjoy, John Marcel Manchester,NH

Look on US Scanner News webpage (should have ussn somewhere in its name,
not hard to find). The article was from Jan. 1996, and dealt mostly with
replacing the IF filter to remove voice clipping. At the end of the
article, the floating birdie fix is discussed briefly.

: Go NY Rangers!

Most of the time, TV stations don't talk on their 450Mhz frequency, they talk on their cellphones so that the competition won't be able to listen in (easily) on their scanners. The one exception, I've heard, is when the news crews are in helicopters where they are not permitted to use cellphones.

> not all that bad.

Each has its own reasons for having. The Ce 232 is a kit that you will have to build or have built. The Opto is manufactured as a uaer installed component.

CE-232 (HB232)

Controls all button functions and receives information from the display of your radio, which is passed to your computer. Controls 4 additional user contacts and more.
Radio operations can be controled directly from radio keyboard, computer keyboard or script commands.
Very configureable but requires some programming experience, soldering ability. No chip pulling required.
Limited to memory channels available on the radio, and speed of radio and computer.
Software has not been upgraded for some time. Has some bugs and many limitations.
Supports Vader Recorder
>
> Operationally the biggest difference is that the CE232 will allow you to
> upload and download channels to the radio for use when the computer is not
> connectedc, while the OS456 will not. That means that you can load a
> specific channel plan before a trip, and throw the radio in the car, and
> when you return, you can UL a totally different channel plan. The OS456
> will not allow you to do this.
>OPTO 456/535

Radio operations are normal while computer cotrol is turned off. When the computer it takes full control of the radio. Only Volume, Squelch, Sound

Squelch and Light can be manipulated. Button presses are not recognized. Display is blank. Can control speaker and Record contacts (supllied with interface).
Various software programs are available that control all types of scanning many not limited by radio function. Can scan by signal strength and PL tones also decodes and logs DTMF (touchtones).
Scans as fast as 50 cps with the 456 and 80 cps for the 535. No memory limitations. No delay limitations. Spectrum analysis available with some software vendors.
5 vendors create software with latest versions demoed (except PROBE).
Cannot program radio for use without computer as with CE-232.

I own both, 232 in one radio and 456 in another. I plan to remove the 232 and make it portable to both the 2006's and the Pro 43. The 232 will only write to the Pro 43 and cannot work in conjunction with the 456. This is due to the fact that when the 456 takes over control the buttons and the display are not functional, which is what the 232 requires to operate. But... with the use of some software a database can be created that the 232 can use to load channals in the radios. This is handy when a computer is not available to control the 456. Therfore the best of both worlds.

Good luck and decide on both, but I rate the OPTO456 miles above on usability with the use of tone scanning, and signal strength scanning and no memory limitations. Plus I drive around with a laptop to control my 456 while mobile

I have the following questions regarding scanning:

1) Has the "floating birdie" problem been solved in later versions of the AR8000, or is it up to the consumer to fix?

2) What modifications have been done in order for the the AR8000 to meet the new EMC req's which came into effect 1/1/96?

3) What scanner models have so far been approved as meeting the new EMC regulations.

> "maintenance" and must of knocked something awack.

The loss of that column of keys when doing a cell mod is not uncommon.
The control line for those keys is shared with diode D2, which enables the
30-50 MHz range. If after removing D4 you still don't have cellular, you
probably killed _D2_ rather than D4.
Try programming a frequency in the 30-50 MHz range - if your entry is
rejected then D2 is damaged / reversed / unsoldered or its trace is bad.
Look for excess solder grounding (or a break in) the trace from the middle
of DA2 (1/4" to side and slightly down from D1), running between D1 & D2,
to C49 (directly up from D2). Also, check that all diodes are aligned the
same way, i.e. you didn't reverse one.
If all else fails, you'll have to take the rcvr and your most innocent
expression back to Radio Shack <g>.

I had some time tonight. I redesigned the main web page for faster download times. At 21,600 bps, the main page downloaded in 15-20 seconds. The newsletters, propagation and start/welcome sections have been simplified and moved to their own pages accessible off the main page. Everything is still there - just moved to new locations.

The main page has (at the moment) 3 graphics: the Ham Radio Online title banner (highly compressed JPEG at about 8kbytes), a picture of the Yaesu FT-50R (JPEG compressed at about 3.7 kbpytes) and the background graphics (4 kbytes). The overall text is about 12 kbytes, plus maybe another misc 2 kbytes (EFF logo, WA logo). That works out to about 30 kbytes total for the main page which should download quickly at 14.4 kbps. As soon as the 12 kbytes of text (hronline.htm) is downloaded, your browser should allow you to scroll around, even if the graphics are still coming in. 12 kbytes ought to download in 10 to 20 seconds depending on your modem speed, server load and Internet traffic.

Please write us at vbook@vbook.com and let us know what you think of the new design.

I can do better than that. I know of actual events where I heard the
person interviewed by the reporter (I was on site), heard EXACTLY
what they said, and then saw a total misrepresentation (complete
with 'quotes' that were fabricated, or to be a bit kinder, grossly
inaccurate) the next day in the newspaper.

I've also recently heard (via scanner) a police chase of a
robber where they had him "in their sights" and then they just "lost"
him... he drove into a neighborhood and just disappeared and they
just weren't good enough to find him. They more or less admitted as
much in their communications with each other.
However, this event was NOT related in this manner in the newspaper
write-up.

So, yes, the press are quite often and egregiously wrong.

Nobody (but you) said it was a conspiracy. It's just a bunch of
liberal journalists (their political inclinations having been clearly
proved time and time again) engaging in the partisan herd instinct.

>inflation, unemployment and interest rates were lower than they have been

Of course, the unemployment rates have been "rigged" to read low.
In the past few years they have changed the rules on how they calculate
the unemployment figure, a change that immediately caused the calculated
{and quoted) unemployment rate to drop without putting a single
unemployed person to work.
Inflation and interest rates have been in this "range" for six years or
so, and are only "low" as compared to the enormous stagflation of the
Jimmy Carter years. Inflation of about what it is now was bad enough to
cause Gerald Ford to institute his ill-fated "Whip Inflation Now"
program in the mid-1970s... so it wasn't considered "low" then.

>for a long time and the stock market was soaring to record heights.Gee,
^^^^^^^^^^^
Things may be rosy on Wall Street, but they're not so good
on "Main Street". The lousy sales in the radio world as evidenced by
the Scanning Convention cancellation (to get back on topic) and in the
most recent editorial by Bob Grove ("The State of the Union", Closing
Comments, _MONITORING TIMES_, June 1996), which had to have been written
before Nat Scan Con was cancelled, is just *one* indication of this fact.

I think that this is particularly appropriate for instances where you
are going to visit an area. I have a *lot* of books and resources for
North Carolina (but our Triangle Frequency list is *still* the best
for central N.C.), but if I'm going to visit Houston, or Atlanta or
Chicago (as I have done recently) I don't want to buy $30 of books for
a two day visit.
Besides, as has been mentioned previously, none of these books are
as accurate as info from active enthusiasts. Not to fault the books,
but things change quickly.
So I may post request for frequencies on occasion and appreciate
others helping me with them. Similarly, I'm glad to point people to
our list (TRIFREQ6.BBS on the RARS BBS 919-779-7277, soon to be
available via FTP) when they need North Carolina info.
And *I* ENJOYED listening to my scanner at Disney World. If you
don't want to listen, don't. I do.

Some time ago there was some discussion on the best antenna
for hand-held scanners. There was a general agreement that
the Diamond RH-77 was a good bet. I have since then bought
3 of them for my handhelds. I have found that they
outperform any other general coverage antennas out there
and they are good to transmit on 2 bands. Anyone out there
have a favorite antenna for handheld scanners???

You are mistaken. They are made for the small radios. The major difference is the Opto is mainly for controlling the scanner's usual scan and search functions and the CE is mainly for automatically programming channels. Apples and oranges, really. You could use both.

Radio Shack PRO-43 Modifications FAQ
< Last modified March 8, 1996>

CONTENTS

1. Introduction
2. Which units can be modified for extended frequency
reception?
3. Companies that will modify the PRO-43 for extended
frequency reception
4. The modifications
extended receive 800 MHz (original mod + solderless)
* extended receive 6-1000MHz
keypad beep delete
improved audio
attaching an S-meter
400 memory channels
extended receive (30-68MHz for European model)
------------------------------------------------------------
1. Introduction

As long as there is a continuing demand for it, this mini-FAQ
about PRO-43 modifications will be posted every month or so.
In large part, it is the file PRO43.MOD from
pub/hamradio/mods/tandy at oak.oakland.edu .

The FAQ now includes mods for

(1) extended receive (800 MHz:
original mod + solderless)
(2) keypad beep delete
(3) improved audio
(4) attaching an S-meter
(5) extended receive (30-68 MHz for European model)

There is also a mod for 400 memory channels, but, to quote
its author, it is very complicated, should only be attempted
by someone with moderate to advanced electronics experience,
and is not for the faint of heart or the "weekend technician."
A brief description is included at the end of this FAQ. If
the mod were included in its entirety, the size of the FAQ
would be increased four-fold.
------------------------------------------------------------
2. Which units can be modified for extended frequency
(800 MHZ) reception?
```

Note: In the United States, it is against the law (Electronics Communications Privacy Act of 1987, public law 99-508, amended 1994 by public law 103-414) to listen to cellular or cordless telephone communications. However, it is not illegal to own equipment that can receive or can be modified to receive such communications, even though it became illegal as of April 1994 to manufacture or import equipment that could be easily modified by the user to receive cellular communications. Equipment manufactured before the cutoff date can continue to be sold until stocks are exhausted. While businesses are forbidden from importing cellular capable scanners for resale, the question has been raised whether an individual can legally import such equipment not intended for resale. The issue is not explored here.

Which PRO-43 units can be modified for extended receive?
The best information is that units sold in the US and Canada can be identified by the following scheme

Modifiable | Nonmodifiable
|
serial number no A in # | begins with A
FCC-ID AA020-300 | AA020-300A

There have been rumors that the correspondence between serial number and FCC-ID may not be perfect, that is, there may be some units judged modifiable by the serial number and nonmodifiable by the FCC-ID, and vice-versa. Anyone with a such a unit should send a message to gdallal@world.std.com so that the information can be incorporated into this FAQ.

Date codes: Inside the battery compartment is a paper label containing the date of manufacture in the form "month A year". For example, 5A3 is May, 1993. The cutoff date after which units could no longer be modifiable is April, 1994 (4A4). So far, the earliest reported date of manufacture of a nonmodifiable unit is 3A4 (March, 1994). There have been *no* reports of a modifiable US 3A4 unit. However, there have been reports of a modifiable Canadian 10A4 unit; it did not have an A in the serial number.

Until the rumors surrounding imperfect correspondence between serial number and FCC-ID can be settled, it is better to check the FCC-ID. But be careful. All units have A's in the FCC-ID. Only nonmodifiable units have an FCC-ID that ends in A.

THE PRESENCE OR ABSENCE OF A FINAL 'A' IN THE FCC-ID
IS A DEFINITIVE WAY OF DETERMINING WHETHER A PRO-43
CAN BE MODIFIED FOR EXTENDED FREQUENCY RECEPTION.
IF THE FCC-ID IS 'AA020-300', THE UNIT IS MODIFIABLE.
IF THE FCC-ID IS 'AA020-300A', THE UNIT IS NOT MODIFIABLE.

It has been reported that some units currently being made for sale overseas can be modified for extended 800 MHz reception. However, it is not known whether this applies to all overseas units or, if not, whether there is a way to distinguish modifiable units from nonmodifiable units.

The PRO-43 was produced under two brand names. My 3A3 unit carries the Realistic name; my 12A3 unit carries the Radio Shack name. At the moment, it is not known whether this represented a changeover or whether both types were produced side-by-side for a time. It is also not known whether their electronics are different.

There are no software modifications for the PRO-43. It is not possible to extend the frequency range of the radio by pushing buttons on the keypad. Such modifications are possible with other models, such as the PRO-51, but *not* with the PRO-43. The PRO-43, made by GRE (General Radio Electronics) of Japan, is one of Radio Shack's few triple conversion units. Radio Shack scanners with software mods are double conversion units made by Uniden.

Modification procedures for other radios are available by anonymous ftp from the pub/hamradio/mods/<manufacturer> subdirectories at oak.oakland.edu.

There is some debate about whether step (5) of the extended receive modification is worthwhile. According to Bob Parnass, from his "Improved Audio Mod", below:

"Now that I have a schematic, I see that the European version of the PRO-43 has different coils and capacitors in the low (mid) band front end filter. That explains why the 75 MHz sensitivity isn't stellar after adding diode D3 to enable 30-88 MHz coverage."

So, if you trash the diode in step 4 or want to quit while your ahead, don't lose sleep over it. On the other hand, quoting ray_reese@tscnet.eskimo.com (Ray Reese),

When I purchased my PRO-43 and did the mod for adding 54-88 Mhz, using the removed cell. diode, I wanted to be able to listen to the sound carrier for the tv channels 2-6 as well as the 72-76 Mhz band. It is worth the trouble to make the mode and it does work well in my area, despite not having the correct coils for that band area. Do the mod anyway, but [if you've trashed your original diode], use a 1N4148 fast-switching diode. Perhaps a 1N914 might do the job also. They can be found at Radio Shack for a cheap price.

---

3. Companies that will modify the PRO-43 for extended

frequency reception

If you'd rather not do the modification for extended frequency reception yourself, Cellular Security Group, 106 Western Avenue, Essex, MA 01929 (508/768-7486) will do it for $40, which includes insured UPS return postage. However, CSG will not move the diode to extend the low band to 88 MHz; they only remove the diode to unlock the 800 MHz frequencies. When CSG is mentioned on the net, two types of comments follow: testimonials from satisfied customers and comments from those with the technical skills claiming that the service seems high priced for just removing the diode. But, there have been *no* reports of shoddy work or damaged radios. (They've modified two of mine.) Units are processed within 24 hours of receipt.

Grove Enterprises' newly advertised Repair Service will perform the mod for $40 plus shipping. They will move (rather than just remove) the diode in units that can benefit from it, but state that there is no way to tell whether the diode should be moved without looking inside. They claim that the determination can not be made from the serial number, FCC-ID, or date of manufacture. For further details, call Grove at 704/837-7081. In order to get a unit modified, a service order number must be obtained from the same telephone number. Packages without a SO# will be refused.

---

4. The modifications

From: armille@afterlife.ncsc.mil (A. Ray Miller)
Summary: cellular (870-890 MHz) and low band (51-88 MHz) restoration for PRO-43

A few people have mentioned the cellular mod for the PRO-43; it turns out you should not remove but MOVE the diode. Doing so allows cellular coverage as well as low band (up to 88 MHz) coverage.

Acknowledgments to Grove Enterprises; this information came from them. They are selling the PRO-43 for $300 which is $50 less than Radio Shack. I have no connection with them other than as a satisfied customer.

PRO-43
Cellular Frequency Restoration and Low Band Expansion

Note: It is not lawful to monitor cellular or conventional mobile telephone conversations.

The following procedure requires familiarity with microcircuit soldering and will violate your warranty. Grove Enterprises assumes no liability resulting from its attempt, nor will accept the modified scanner for return under any condition.

TOOLS NEEDED: Fine point, low power soldering pencil; solder wick or a desoldering tool; pointed awl, hemostats or pointed tweezers; small Philips screwdriver; solder.

1) Remove the battery, antenna and back cover (held in place by four screws).

2) Remove the six screws holding the top circuit board in place. Carefully unsolder the two antenna connections from the board. Bend the antenna ground tab fully up from the board. Carefully lift the board, unplugging the black connector at its base, and lay the board out of the way on its bundle of colored wires.

3) Remove the two screws from the next board and lift it, carefully unplugging the white connector at the bottom of the board. Lift it up and lay it aside on its brown wire (which can be unplugged if necessary).

4) Unsolder and remove the metal shield from the final board, revealing the microprocessor; note the row of diodes labeled D1-D5 above it. Only diodes D1, D2, and D4 are present; assisted by a pointed tool, unsolder and remove D4, the lone diode (this restores cellular frequencies which will be searched in 30 kHz steps).

5) Resolder the removed diode carefully into position D3 to extend low band coverage to 88 MHz.

6) Reassemble the boards, paying particular attention to the alignment of the plugs. Test the radio by entering any frequency between 870 and 890 MHz (cellular) and 51-88 MHz (low band).

From: IN%"savage@dg-rtp.dg.com" 2-FEB-1995 17:55:07.31

BTW, I did something similar [to the mod that follows] but MUCH easier... No soldering, removing antennas, PCBs, etc..

Just open up the Pro 43 and look down on the bottom PCB from where the batteries usually lie. You'll see the diodes there. Simply take an xacto knife and and break the solder on the D4 diode (left-most on mine) on the side facing you. I just cut back-and-forth for a bit. Once the solder (it's surface mounted) is weak enough, I just bend up the diode a bit from the PCB. Presto. I left mine hanging on the one side with solder. If you continue to work it a bit, you can probably remove the whole diode.

--Ed

From: springel@umich.edu (Jason G. Springel)
Subject: MODing a Pro-43 without soldering

I just purchased a new Pro-43 to replace my Uniden 200XLT after reading many of the praises for the Pro-43 on this newsgroup. I decided to try and MOD it, but don't have a lot of experience with a soldering iron. After examining the scanner's innards, I found it was quite easy to "fix" with nothing more than a minature philips screwdriver and some small needlenose pliars.

********** Standard Discalimer from other MODs:

1-It is against the law to monitor cellular or mobile telephone calls.

*****2-Procedures outlined below [DO NOT] require knowledge of
microcircuits, soldering and assembly techniques.

*****3-You will [NOT] need a low-wattage soldering iron, solder and
other various tools to help in the procedure.

4-The following procedure will void your warranty.

****
Here is my new MOD:

Step 1

Remove the battery, antenna, and back cover which is held in place by
four screws. Place the scanner keypad-side down on your working surface.

Step 2

Remove the six screws holding the top circuit board in place.

Step 3

Using a VERY small screwdriver (I used one from a Radio Shack kit),
remove the two screws from the lower circuit board. Looking down at
the unit, you will see that the screw on right side of the lower
circuit board can be easily removed. Remove the screw on the left side
by by sliding the screwdriver between the top circuit board and the
metal frame which holds the two boards together.

Step 4

With these two screws removed, you can now lift the entire top panel
(antenna, volume, and squelch knobs) along with the top two circuit
boards as one unit. The two circuit boards will be connected to the
final circuit board (the one attached to the front section of the
scanner) by several wires. Simply set the top panel/circuit boards
alongside the front section of the scanner and you can leave these
wires connected.

Step 5

The microporcessor is located under the large metal shield on the final
board (the front section of the scanner with the display and keypad).
If you look under metal shield from the side closest to the bottom of
the scanner, you should see the row of diodes labeled D1-D5.

Only diodes D1, D2 and D4 should be present.

Use a small pointed tool to break off D4. You actually don't have to
remove it completely (unless you want to use it to restore additional
frequencies as explained in other MODs), you can just lift one side so
it dosen't make connection and then put a small piece of tape or heat
shrink over it, so it won't. Make sure it's not lifted to high or the

boards will not fit.

This will restore Cellular Frequencies in 30 kHz steps.

Step 5

Reverse the process to replace the top panel/circuit boards and the two screws that connect the lower circuit board. Replace the 6 screws from the top board. Replace the cover, etc.....

...the diode positions on the cpu board, of which only three are filled look like this. Where X equals a diode soldered in place.

D5 D4 D3 D2 D1

O X O X X Normal configuration

O O O X X Cellular modification(D4 removed)

O O X X X Lo-Band modification(D4 in D3's place)

These directions were based on an original MOD design whose origins I do not know. My thanks go out to the original author of that MOD! Hope this helps those of you who do not own a soldering iron!

PRO-43 Shortwave & Extended Receive
Al Mellon N8KLI

(This modification is only possible on radios able to be modified to receive the full 800 MHz range.)

Scope and nature of the modification: To allow the PRO-43 to receive frequencies from 6 MHz to 1000 MHz. This is accomplished by setting the PRO-43 to non-standard splinter frequencies, the CPU will then step the radio beyond the normal band edges. To derive the non-standard splinter frequencies it is necessary to change the diode configuration matrix, and to use the monitor-search function. The hardware modification should take about thirty minutes. The remaining programming / search will take as little as 45 minutes (depending on how interested you are in the signals you encounter during the 806 MHz to 30 MHz search to be run).

I made a few attempts to make deals with various radio mod shops. Most felt the time needed to make key pad entries was too long to make a profit.

< This is a lengthy modification. It can be found in its entirety in /pub3/hamradio/mods/tandy/pro43swl.zip at oak.oakland.edu >

From: ross@novax.llnl.gov
Date: 19 Aug 92 16:51:08 GMT

Here is my keypad beep delete mod for the RPO-43:

1. Remove battery.
2. Remove back cover (4 screws).
3. Remove top board (6 screws, desolder two antenna connections and bend

antenna ground lead up out of the way). Be careful of black connector at bottom of board. Flip board over and lay aside (wire connectors need not be disconnected).
4. Remove middle board (remove 2 screws and wire connector). Be careful of two multi-pin connectors along underside of board. Set middle board aside.
5. Locate 10 pin connector on side of bottom board (labeled CN3). Note that one end of connector has pin 10 labeled as such. Count back to pin 6 and bend pin 6 ninety degrees towards the large RF shield. Make sure the bent pin clears the RF shield.
6. Reassemble and your done OR do the cell mod since you are so close.

Have fun. Gary Ross >usual disclaimer>

Subject: Improved audio for the PRO-43 portable scanner
From: parnass@cbnewse.cb.att.com (Bob Parnass, AJ9S)
Date: Wed, 2 Dec 1992 01:15:35 GMT

IMPROVED AUDIO FOR THE PRO-43 SCANNER

by Bob Parnass, AJ9S

The Radio Shack PRO-43 scanner audio is too bassy.1 The lack of treble makes it difficult to hear the PRO-43 in noisy situations, especially while listening in a car or truck. Louis Shirley sent me a schematic and suggested I remove C341, a tiny 0.015 ufd surface mount capacitor.

I'm glad to report that removing C341 made a great improvement. The audio is now much "crisper," more like the Uniden 200xlt, although still not quite as loud. Turning the volume control up still overloads the PRO-43's small, internal speaker, but there's less need to do that once C341 is removed.

The PRO-43 contains 3 printed circuit boards, and the middle (second) board contains the audio circuitry. Finding C341 is difficult, as it is neither marked with a value nor a component designation. It is located on the foil side of the middle board, under IC304, an LM386 amplifier IC. C341 is in parallel with, and physically next to, R350 (33,000 ohm). R350 is slightly larger than C341 and is marked 333. Both R350 and C341 are connected between pin 2 of the LM386 and ground.

A Note About 50-88 MHz Reception

Now that I have a schematic, I see that the European version of the PRO-43 has different coils and capacitors in the low (mid) band front end filter. That explains why the 75 MHz sensitivity isn't stellar after adding diode D3 to enable 30-88 MHz coverage.

Subject: S-Meter for PRO-43
From: schuster@panix.com (Michael Schuster)

Found this on the Fidonet scanner echo:

=====begin quoted text=================

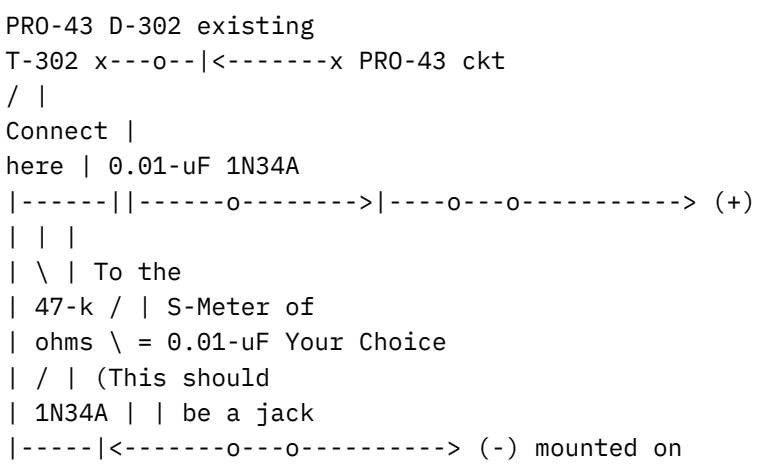
Date: 02-06-93 00:24
From: Bill Cheek
To: All
Subject: PRO-43 S-Meter!

Greetings Scanner Fans!

It had to happen! The fundamentals for an S-Meter exist alive and well in the PRO-43! Only a simple circuit and your choice of meter, analog or LED, is required for a jim-dandy S-Meter function!

The key point in the circuit is the cathode of D-302 located on the bottom (solder side) of the AF Board (middle board). You will need the Service Manual for the PRO-43 to find it as it's not marked and it would take me 10,000 words to guide you to exactly where it is located. Call Tandy National Parts at (800) 442-2425 to order your manual: approx $10. Now here is the deal:

Locate D-302 and either build the following circuit right there on the back of the AF board in the vicinity of D-302, or solder a wire to the cathode of D-302 and route it to somewhere else more convenient to feed the below circuit. This wire ought not to be very long, though, say not more than a couple of inches. Refer to the ASCII schematic diagram as follows:



^ PRO-43 Ground^ the case of
Legend: the scanner.
|
1. ---||--- and = are 0.01-uF capacitors; disk, mylar, monolythic, chip
|

2. --->|--- and ---|<---- are germanium diodes, 1N34A
| is cathode
< is anode

3. o means a connection, preferably soldered

4. The 47-k resistor is self-explanatory, I hope.

5. -------- and | are wires/conductors.
|
|

6. x is existing PRO-43 circuitry

If you use an analog meter, preferably a real S-Meter like salvaged from an old junked CB rig, then rig it as follows to connect to the circuit above:

```
5-k Trim Pot
(+) --------/\/\/\/\---o--------|
| | |
This should |-------| |
be a plug of +
some sort to The S-Meter
connect to the Terminals
mating jack on -
the scanner |
|
(-)----------------------------|
```

You can also build the 10-segment LED S-Meter as shown in Volume 2 of my SCANNER MODIFICATION HANDBOOK, available from leading mail order radio dealers everywhere. ISBN 0-939780-14-3 published by CRB Research Books, Inc. Commack, NY.

After connected and working, locate the PRO-43 very near a known strong transmitter, perhaps a ham transmitter, a police cruiser, your favorite security guard's handheld or right next to a cordless telephone, or anything else known to transmit a strong signal. Tune the scanner to the frequency, and adjust the 5-k trim pot above so the meter reads exactly full scale. All other signals will read proportionally lower to yield "relative signal strength" measurements! A hell of a circuit here, boys & girls! Have fun!

Subject: PRO-43 w/400 CHANNELS HERES HOW!

IT IS NOT FOR THE FAINT OF HEART however.

PRO-43 ENHANCEMENT
MEMORY EXPANSION & "FADE-AWAY" LIGHT
Brett Bennett 4/12/94
bbb@kuhub.cc.ukans.edu
Copyright 1994 B&D Electronics All Rights Reserved

INTRODUCTION

The following document details two enhancement modifications that are possible on the Radio Shack PRO-43 scanning radio. The first modification doubles the factory standard memory capacity, allowing you to enjoy an additional 200 channels of memory, plus 10 more monitor memories. After completing the first modification, it is a fairly simple matter to add a 7 to 10 second delay feature to the LCD back-light lamp circuit. I designed and performed these modifications on my PRO-43 and they do work. As I understand it, there (has been/is being) presented in WORLD SCANNER REPORT a similar memory expansion. I have not seen this modification and for all I know it is a better way of doing it. What is presented is a 'clean-room' design of my own that to the best of my knowledge is the only one to also offer a time-delay for the LCD back-light. Having said that, let me say:

I ASSUME NO RESPONSIBILITY FOR ANYTHING THAT MIGHT HAPPEN TO YOUR RADIO SHOULD YOU OR ANYONE ELSE ATTEMPT THESE MODIFICATIONS. WHILE REASONABLE CARE HAS GONE INTO THE PREPARATION OF THE FOLLOWING DOCUMENT, I CAN NOT GUARANTEE THAT THERE ARE NOT ERRORS.

The procedure described below is very complicated, and involves the soldering and desoldering of very tiny components and the cutting of printed circuit board traces. While the procedure is not irreversible, it will leave permanent scars inside your scanner. It should only be attempted by someone with moderate to advanced electronics experience. I don't think it should be attempted by, to quote someone else, a "weekend technician." If as you read through this you feel intimidated by the jargon and required procedures or if an electronic schematic looks like a strange piece of modern art to you, then this might not be the 'mod' you are looking for. The following document will assume you have obtained the materials listed below, especially the Service Manual, and you have studied the circuit in some detail. I will not describe

in great detail where every component is or where every solder point on the logic board should be placed. Having the Service Manual, and having studied the drawings therein will allow you determine to where it is I refer.

REQUIREMENTS

1 - PRO-43 Service Manual. (Tandy Parts # MS-2000300 - approx. $6.00)
1 - CD4053 - Triple - SPDT analog switch - Surface mount package (DigiKey #CD4053BCM-ND - approx. $1.50)
2 - 93C67 EEPROMs (Tandy Parts # MX-8050 - approx. $13.00/each)
1 - 100k x 5 resistor network. Common lead type. (DigiKey # Q5104)
1 - UN2111 PNP transistor (Q1 on Logic PCB. Tandy Parts #)
1 - 1 uF 16v capacitor.
1 - 10 MOhm 1/8-1/16W resistor.
Misc.:
Wire wrap wire-30 gauge. (Radio Shack)
Grounded soldering iron with approx. 1/32" tip or smaller.
Desoldering Equipment.
Digital Volt Meter. (Used to double check your VCC and Ground connections, pre-check switching assembly)
Utility knife with fresh sharp small blade. (Needed to cut traces.)
Strong hand held magnifying lens. (Needed to check solder joints.)
+5-10 Volt bench power supply. (Used to check switching assembly.)
Anti-Static work place and grounding wrist band.
Very fine needle nose pliers, wire cutters.

From: IN%"millingtoj@oldhamlrd-po.oldham.gpsemi.COM"
"John Millington" 17-DEC-1995 04:55:31.71
Subj: RE: pro-43

The European Pro-43 comes with a diode in D1, D3, +D5.
Remove the diode from D5 and solder it in position D2.
The scanner will now cover 30-68Mhz.
Usual disclaimer.

I still remember when the media were discussing all of the horrible
things that might happen if the Market ever broke the ONE thousand mark.

Anyway, I have to agree with the assessment that the scanning market
is in a severe crash. A lot of things are fueling this trend.

1) Poor national economy (politics aside, if mom-n-pop think the
economy is bad, they will behave as though it is bad).

2) CTIA and industrial greed. (purchase of legislation so that big
money can make bigger money, suppression of competing technologies, continued
dispersal of incompatible communication systems despite customer and governmental
pleas for standards, etc, etc, etc.)

3) Governmental/law enforcement fear of criminals. (More criminalization
of harmless activities, including scanning. While some of the RTKBA folks may be
fostering an extreme view, it is historically accurate to point out that totalitarianism
generally follows a tendency to restrict private ownership of firearms AND communications
equipment. Those restrictions are advertised as being for the legitimate protection
of society from various evils that have nothing to do with the power-seekers' real
agenda.)

4) Loss of analog scannable targets in populated areas. (Florida, for
example, is becoming saturated with trunked systems, many of which are digital.
My own county - Monroe County, NY - is phasing in a new comm system that, while using
the existing frequencies for operational communications, will almost require the use
of digital pagers to know what is being dispatched and why. Depending on how this
CAD system ends up being finally implemented, the digital paging may be on multiple
frequencies. It's being tested on a single channel covering all groups now, but the
officials want separate frequencies for everything.)

5) Lack of innovation in design and capabilities of scanning receivers.
(Potential causes are many. It could just be lazy US industries who have already made
their big bucks off the consumer and don't want to dilute the bottom line with more
R&D costs, or the fact that scanner manufacturers are the same companies that are
building and selling the new "scanner-proof" radio systems. Remember what happened

with the Radio Shack PRO-2004?)

I took almost 40 copies of the "Scanner Master Upstate New York Guide" to the Rochester (NY) Hamfest this weekend. The regular cover price is $29.95 plus tax. I was selling them for $21.99 plus tax and sold TWO COPIES. This is at a hamfest with an annual attendance in excess of 10,000 and with regular growth - second only to Dayton!

As far as I can tell, the market is shrinking for scanners and scanning-related peripherals. Apparently I'm not the only person in the biz who feels this way (I've read similar comments by Rich Barnett, Bob Grove and others). There may not be another edition of "Scanner Master Upstate New York Guide" if we can't justify the production costs. I for one have no intention of riding the market down. I just can't afford to.

My understanding is that people who bought the "outers" of the ar3000A did so to replace a banged up case, bad keyboard, etc. These scanners are used by some as portables since they run off of 12V. However, there is no soft cover for the AR3000A, hence the need to fix it up cosmetically if used as a portable.

There is still some sort of hidden story going on with these AR3000A boxes. Now if somebody who knows did an anonymous posting.....

DE>Subject: Weather Baloon Freq.

DE>I recently recovered a NOAA "Radiosonde". Anybody know what freq this
DE>operates at and the power of the battery-as it is dead.

They used to operate at about 1650 MHz having a pencil triode inside a crimped-on cavity that had an integral drooping-ground-plane antenna. Many of the transmitter assemblies were made by RCA and the whole assembly was cheaper from a distributor than the pencil triode by itself. In the old sondes, the battery was a one-shot package, very cheap, activated just before balloon launch. In the 1960s the USA Dept. of Commerce and military weather stations launched about 200,000 per year, total. The triode-cavity assemblies were still available in the mid-70s. Bonzer Corporation used such pencil triodes and cavities in very-small-boat, short-range radar.

Telemetry consisted of an audio oscillator which was mechanically switched by a barometer between altitude, temperature, and (if memory serves) a humidity-sensing resistor. A radar-like receive-only parabolic dish mount would lock onto the the sonde and track it in azimuth; recorders would take down the telemetry tones and azimuth reading. I don't know if two separated tracking receivers were used to get a triangular fix on ground position, but such would be possible.

I don't know what is used in sondes nowadays, but the older pencil triode transmitter had to be _pulse_ modulated to avoid early demise. An old sonde package isn't useful for anything but a conversation piece. :)

DP>>approach director and the call would normally be structured like:

DP>>AC: "Gatwick director good morning/afternoon/evening this is Speedbird
DP>>4330, 260 knots towards Mayfield (VOR), we are a 737 with Zulu (or
DP>>sometimes "information zulu")."

DP>>Now I understand everything here except the last part of the call, the
DP>>phonetic often is different, but I have no idea what this "information
DP>>zulu" or "zulu" or "pupa" actually is.

DP>>If anyone knows this would really help out, and stop me from pulling my
DP>>hair out every time I hear it. None of the reference books on the subject
DP>>make any reference to it.

It's aviation language, standard in the International Civil Aviation
lingo. "Information <alpha to zulu>" refers to local weather
and airport conditions which are broadcast as a recording on a VOR or
VORTAC 108-118 MHz transmission. A pilot acknowleging he/she has
"information papa" tells the tower or approach controller that the
controller doesn't have to repeat the same "papa" info on the comm
radio. Saves a lot of time and effort, reduces comm confusion at
busy airports.

VOR is Very high frequency Omnidirectional radio Range, a very old
acronym insofar as aviation is concerned. It has an antenna pattern
rotating at 30 Hz with 30% equivalent AM and a subcarrier at 9960 Hz
which is FMed at a 30 Hz reference phase, 0 deg. at magnetic north.
Audio can be sent as AM in between the low and high audio, often used
for recorded "information <alpha to zulu, A to Zed if you will>" but
also used by a tower as duplicate comm for a busy or confused pilot.
Recorded conditions are often quicker sources for local weather info
than standard broadcast news.

I use the Burbank-Glendale-Pasadena airport (the old "Lockheed Air
Terminal" in Burbank, CA, ICAO identifier letters BUR) VOR as my
local weather advisory. It is only a mile and a half away from me so
my homebuilt aircraft scanner has no trouble picking it up. Today, a
Saturday, information Sierra had surface temps at +98 F. :(

DP>> [to Dr Pepper]

DP>WELL I DON'T KNOW, BUT "ZULU" usually means GMT with reference to
DP>time. NO????

Usually, yes. However, ATIS information recordings are identified alphabetically and the first one after local midnight is Alpha. The next is Bravo, next Charlie, and so on. Since civil aviation common language is English by international convention, a phonetic alphabetic ordering of condition recordings works out fine.

By the way, enroute time is seldom given by pilots as any definite hour, only so many minutes to or from an hour. At jet speeds, it becomes a burden to translate to local time zones in a cockpit; too many other things to translate in the airplane. :)

--->Hmmm....and where do you suppose the press gets the story?
Scanners maybe?
--->Also, can you explain _why_ the 'local rag' would want to distort
the story?
--->Part of that new world order thing?

In this area, the local mall has a pretty high crime rate. The mall
security & local pd freqs are busy all the time. Lifters, muggings,
rapes & car jackings in the parking lost, gangs in the mall. If you
depended on the local media, you wouldn't know about 98% of it.

Bad for business, don't ya know?

Also, this is a GM town, so any news reguarding the company & the
union is at least somewhat slanted toward the company.

>Do you have any sources for these "special" versions of the bearcats?

Glen:

I purchased my UBC-3000XLT from Javiation in the UK. I used my VISA card and was finaly charged a shade under $400 ($397). They have a good reputation on the 'net. I have had a couple of items from them and always received good service.

They have a good web site at http://www.demon.co.uk/javiation/

Harry.

>of society from various evils that have nothing to do with the power-seekers' real
>agenda.)
in most localities, Its always been illegal to use a scanner or a
firearm (and for that matter a motor vehicle) in the commission of a
crime. The laws haven't changed dramatically. If you are a 'solid
citizen' and want to own a shotgun, rifle, or high quality handgun the
laws may slow you but they do not prohibit it. I personally dont see
the need for an AK-47 to do hunting or protect yourself from the
average intruder. If you feel you need to rocket launchers or high
power people killing capability to protect yourself from the
government, I would ask why you are so paranoid as to feel they are
have singled you out.... Just what is it you are building up an
arsenal for?
Yes scanning of personal phone conversations has been outlawed... AS
has stealing cable television and peering in your neighbors bedroom
window. The rights and freedoms you enjoy are because you are a
contributing member of society, you are expected to give privacy to
your neighbors and not to steal weather it be a candy bar or an
electronic signal. When I became involved with scanning in the 1970's
I can remember being cautioned even then that I could not use the
information I heard for my own profit...Whats changed?
> 4) Loss of analog scannable targets in populated areas. (Florida, for

>CAD system ends up being finally implemented, the digital paging may be on multiple
>frequencies. It's being tested on a single channel covering all groups now, but the
>officials want separate frequencies for everything.)
This is something which I agree is affecting the scanning hoby...
However it is a long term trend not affecting all hobbists in all
communities... Notice that many of our fellow scanner owners are
beginning to work out methods of decoding these signals. Drop by the
optoelectronics booth some time and see whats being done there, or try
looking at the software decoding schemes being sold which use the dsp
capability of sound cards to decode various digital services. The
death to our hobby will occur when the transmissions are heavily
scrambled not just digitized.
> 5) Lack of innovation in design and capabilities of scanning receivers.
>(Potential causes are many. It could just be lazy US industries who have already made

>R&D costs, or the fact that scanner manufacturers are the same companies that are
>building and selling the new "scanner-proof" radio systems. Remember what happened
>with the Radio Shack PRO-2004?)
What was that I guess I missed "what happened' The processes for
following trunked systems exist... But the cost to design them and
bring them to market is always an issue. Wiude band scanners could
have been made in the 70's but who would have paid the price or given
up the corner of the room it would have required... If the radio can
decode it and move to the new frequency.. A scanner can do the same...
Are you prepared to pay half again the cost of an aor3000 just so you
can track trunked calls? Give the technology time....

> I took almost 40 copies of the "Scanner Master Upstate New York Guide" to the
>Rochester (NY) Hamfest this weekend. The regular cover price is $29.95 plus tax. I was
>selling them for $21.99 plus tax and sold TWO COPIES. This is at a hamfest with an annual
>attendance in excess of 10,000 and with regular growth - second only to Dayton!
How many copies of percons CD-ROM covering the entire US at 29.95 were
sold?.. The same data is in there.... I bought The CD rom and found I
no longer need to buy 'regional scanning directories'. I previously
purchased several of the regional directories because I travel rather
extensively through the east coast... The fact that you cant sell one
item doesn't mean that the industry is dying. This is simular to
saying that because buggy whips dont sell that the transportation
industry died... It didnt it just moved into a new phase!
> As far as I can tell, the market is shrinking for scanners and scanning-related
>peripherals. Apparently I'm not the only person in the biz who feels this way (I've read
>similar comments by Rich Barnett, Bob Grove and others). There may not be another edition
>of "Scanner Master Upstate New York Guide" if we can't justify the production costs. I for
>one have no intention of riding the market down. I just can't afford to.

>73 de Dave, NF2G
Its been said that even a mass murderer will blame someone else for
his failures....

Yes scanning as we know it may be dying... But there is a market for new methods of scanning, New methods of distributing frequency lists...new decoders... Sniffers (aka opto scout) the industry is changing and technology is presenting new challenges... But then the crystal based Regency scanner I bought in the mid 70's wont receive most of the channels now in use by my local police and fire (reguardless of if they are trunked or not) and it never did receive cordless telephones and cellular didn't exist at the time.... But then a mechanical (scanning disk) type television wont work today on any channel, the internet we send this message on wasn't available to the average citizen even 5 years ago, Federal express was formed to fill a market that the US post office STILL hasn't managed to adequately deal with. The world changes, its called progress and it occurs faster in the high tech areas than in any other part of our culture.
Personally I attended dayton a few weeks back... Many say sales were off and attendance was down.. How much of it was related to economics and how much was related to the new date? I do know that you still couldn't get a hotel room in town. But I also noticed that There wasn't the same accent on scanning that there was last year. Last year at least half a dozen venders were hawking new software to control your scanner, with or without an opto board. This year I saw three booths talking about it, two using the same program, the third selling their own...Is software controlled scanning dead... No just not as high on the developers list of priorities since the competition picked up...

OK so the convention was cancelled. Was there hundreds of new products being brought out this year? Is there a new focus in scanning that is breaking right now that everyone wants to find out about? I think the answer to both of these questions is the major reason the convention had such a bad response that it was cancelled. Scanning isn't dead, But its changing and this is the period of transition.. Much like a ball club in its rebuilding years there's not alot of excitement right now, but I'd suggest that maybe we need to stay tuned!
If you see the indudtry dying... Then for you it is.. But then again maybe you need to see what business it is that you are in... Do you sell books of frequencies, or are you part of the nationally growing communications industry?

I second the motion. The BC3000XLT is a super scanner! I got mine
several months ago from ScannerWorld for $339 plus ten bucks shipping.
The sensitivity is great with a discone and overload ain't bad either.

Once you have it, there are lots of keypad tricks. Plus, SOME people
actually listen to cellular with the darn thing at 1005-1030MHz.

Cheers, Ron Cain

It is the same product as the Trident TR-2400.

Better user interface than the prior Nissei scanners that AOR has sold.
(e.g. AR1000/XLT, AR1500/e/ex)

Some chronic, low-level intermod throughout a couple of bands (you have to
set the squelch higher).

There are better scanners on the market; there are worse :-)

: Well, it's probably illegal (except to certain agencies) in the US. Of
: course a lot of people would be intersted in it. Try Canada.

Yes, I agree that I myself would not want to be caught selling something like this in the US.

Also, for curiosity only, how do you guarantee you can pick up your target every time? I don't know that you can with just one scanner. Unless you know that the victim is always going to start his call in a certain cell. If you don't, you'll have to be scanning all the control channels and you might miss your target if his call begins exactly at the time your receiver is on another channel. If the victim keeps his phone turned on you can (sort of) keep track of him. However, he might not turn on the phone until ready to make a call. I think in this case the odds are against picking him up. I know that they use AMPS down under where you are, but in the US, they have changed the system recently to keep the number of times the ESN/MIN goes over the air to a bare minimum, to make this data harder to snarf. I don't know if those changes were made where you are. So even if the person's phone is on all the time you might have trouble keeping track of where they are.

The devices sold in Canada which track cell users probably have a whole bunch of RF boards in them so they can "watch" all control channels at the same time. These things probably cost $10s of thousands, too, so it doesn't really matter for most people whether they are legal or not. The only users would be drug dealers, people engaging in industrial espionage, and law enforcement.

: If anyone can point me to a resource or fill me in on this particular scanner, please let me know.

The date code of 6A3 means month 6 year 3 (1993), generally, the cutoff point for scanners is that those made March 1994 and after cannot be easily modified for cellular. Some made before this date can, it varies by the model. The 2026 can be easily modified by cutting a wire inside if it has an "earlier" date. The industry played make-believe for many years (1986-1993) selling scanners which were cellular-"incapable" yet all you had to do was cut a little wire inside to unblock them.

185. NEWBIE question - please help

Source record: 232422

Just got a BC3000XLT (love it!).. I got a question concerning scanner frequencies. The Fire/Police in my area is listed as:

856.4875/811.4875 POLICE/FIRE/CITY Arlington (Trunked+: 57,58,59,60)
856.7125/811.7125 POLICE/FIRE/CITY Arlington (Trunked+: 57,58,59,60)

Could someone please translate the above?

Should I scan 856.4875 - 856.7125 ? I tried this, and it's blank (for hours!)

Also, I understand Trunked means the next available frequency is given to the radio, but what is: 57,58,59.60 mean?) Is that how many frequencies up from 856.4875 the freq goes, or does it mean 856.57, 856.58 is used, etc?

Thanks!

: What you see is the Digital Music Express system. This is the Muzac of
: the 90's. The reason you can't pick anything up is because the way the
: signal is encoded. Apparantly, you have to have just the right antennae
: and all of the music is encoded on one or two bandwidths. That's why a
: receiver box is required for reception. At least that's what the company
: told me when I got the system for my bar.

The DMX system you have in your bar is very likely operating off a
satellite dish. The things I was talking about were definitely *not*
satellite receivers. They were aimed at some transmitter on the ground
even though they were somewhat dish-shaped. Also, the places were things
like McDonald's, Kentucky Fried, etc. which are good customers of Muzak.

Hi Douglas,

The Lojack car alarm is located on 173.075 MHz. The data is transmitted in 200 millisecond bursts every second.

Hi Jonathan,

I live in Pittsburgh and would be more than happy to send you out
what you need. The majority of what I have is on hardcopy, and not online.
Let me know specificially what you are looking for. I have pittsburgh police
channels, EMS, and even a couple fast food joints I've found.

Dole was in Columbus, OH the other day and there was some Secret Service traffic on Charlie 165.375 simplex in the clear. I could only hear the command post. They mentioned "Patriot" aircraft.

Also, usually they use a PL of 103.5 Hz when they transmit in the clear, but they weren't using this the other day. Do they only do this on the repeaters?

>856.4875/811.4875 POLICE/FIRE/CITY Arlington (Trunked+: 57,58,59,60)
>856.7125/811.7125 POLICE/FIRE/CITY Arlington (Trunked+: 57,58,59,60)

>Could someone please translate the above?

856.4875 and 856.7125 are the repeater frequencies (main tower).
811.4875 and 811.7125 are the repeater input frequencies (moble
radios) to the higher frequencies.

The higher frequencies are simply a re-transmission of the lower
frequencies which are separated by 45 Mhz. When scanning it is
usually better to listen to the upper frequencies because they are
usually the strongest (unless one of the mobiles are near by).

If you have the available channels on your scanner, you can enter the
lower frequencies so you can tell when something is happening close to
your location. I use some scanner control software on my computer
that alarms when it receives a repeater input frequency.

>Should I scan 856.4875 - 856.7125 ? I tried this, and it's blank (for
>hours!)

Are you sure these are the only two frequencies? I don't believe I
have ever seen a trunked system that uses less that 5 frequencies. If
you are doing a limit search for the other frequencies, you might try
scanning from 856.0125 to 860.9875. These bands are usually listed in
your scanner's owner's manual.

>Also, I understand Trunked means the next available frequency is given
>to the radio, but what is: 57,58,59.60 mean?) Is that how many
>frequencies up from 856.4875 the freq goes, or does it mean 856.57,
>856.58 is used, etc?

I'm not sure what the other numbers mean unless they are private line
tones used to allow more that one group (police, fire, EMS, etc.) to
use the same frequencies (althought not all at once). Someone else
might be able to give you some more info.

Does anyone have a recommendation for a good (<$500) new handheld scanner
that can be modified for cellular? I have read that anything made
after April 1994 can't be modified, but I don't know if that is a
hard and fast rule. If late models can't be modified, are new models
that are modifiable available overseas (such as U.K.) that can be
shipped here?

Are you in Australia? What system does this board work with, AMPS or
GSM?

There were a couple of these things available on the market a couple of
years ago in North America. Could only be sold to the service
industry. I think they required a dedicated radio to monitor and decode
the service channel and another to drive the traffic channel radio. Is
yours any different?

>It is also outragous that anyone would consider underground rail systems at a known earthquake site, but that it just what they did in downtown Hollywood!<

This is the most patently insane statement every uttered about subways. Underground is the SAFEST place to construct a rail line; earthquakes cause very little stress underground (its the resonance between the ground, foundation, and building that causes building damage). The tunnels in Tokyo, for example, are far much "weaker" than the design for the LA subway system and they have survived numerous, large, and tremendously destructive above ground damage easily.

These are common facts known to all geologists. . . which is why the "common knowledge" is bogus. . .

There are two manufacturers of wireless headsets for Drive-Thrus:

Panasonic
3M

Both operate as a half-duplex system and use a PL Tone to communicate
with other employees internally and a PL Tone to commuincate with the
customer at the drive-up speaker.

The older Panasonic and 3M systems transmit a constant carrier on the
speaker frequency (repeater).

The newer Panasonic systems only transmit a carrier on the speaker
frequency if a car is present at the drive-up speaker.

Check out the following URLs for a list of frequencies that they operate
on:

Source record: 232445

To install the OS456, you basicly just unplug a bunch of wire connectors, insert the board, and plug in the original connectors to/from the new board. No soldering involved.

When the computer control is not active, the radio operates as before, with whatever memories you had prior to computer control.

The CE232 allows you to upload/download freqs, at the expense of a good deal of soldering. It also allows you to use the radio without the computer attached if you please.

One advantage to the ce-232 is that you can program your scanner from
your computer! This is great if you have the extra memory mod, saves
tons of time

An advantae of the Opto is it will decode DTMF codes.
Not sure if OPTO will work in cell freqs. the 232 does

210. OptoLinx Universal Interface

There IS a hardware mod for the C-508A that restores full
cellular coverage AS WELL AS 30KHz steps in the cell bands.
I don't remember where I got, but search some of the
popular web sites and you WILL find it.

It is fairly simple and involves removing two of the SMT devices
on the main board. I did it. It works.

RLS (shenb@ix.netcom.com) wrote:
: Just picked up a great little shirt pocket "HT" at the Dayton Hamvention
: and I'm very impressed with the receive capabilities. Dual-Band
: Transmit - 60 memory channels and it receives 110-190 mhz (am for air
: band), 320-400 mhz, 400-500 mhz and 700-980 mhz. The cellular areas are
: blanked out from 823-850 mhz and 868-896 mhz and not modifiable acording
: to Standard's technical advisors at the Hamvention because the acess lock
: is burned into the cpu controller. The way around that hurtle is very
: simple. Multiply the 1st IF freq (23.05 mhz) X 2 and you get 46.1 mhz.
: I simply added that number in my head to 868 mhz and came up with 914.1 -
: start listening from 914 mhz thru 943 mhz and you hear the entire
: cellular band. Sensetivity is very good as the receiver is very hot and
: not bothered by any intermod that I could detect. While the transmit
: power is tiny (300 mw on 2 AA penlight batterries) it is stingy with the
: batteries. I am yet to change the first set of batteries installed at
: Dayton.

: Great Radio! much improved over the CT-108-A and Dual-Band Transmit to
: boot

I hope this is the right place for this!

I have a RS Model PRO-46 100 channel handheld scanner. I haven't used it in 6 months, and a guy at work wants me to sell it to him. I paid $250 I think about 4 years ago, and wanted to know what it was worth right now. It does the cell freq. w/the keypad mod I saw on here a while back. It has the nicads & charger, and has never been dropped.

Please let me know,

Thanks,

Sam...

I'm thinking about buying a new BC860XLT that is one sale, but
I have a couple of questions I hope someone here can answer:

1) Is this radio modifiable? I haven't been able to find
anything on the net except for its predecessor, the BC855XLT.

2) Is it possible to buy an owner's manual for the radio? This
one I'm eyeing is cheap in part because it's missing the manual,
antenna, and wall wart.

Thanks,

Is this another example of someone in the US thinking that EVERYONE in the world should be the same as the US?

FM CB is used in countries outside the US. Australia is one place and it would seem that France is another.

From some of the comments that I see here, it appears that many posters to this group have very closed US minds and dont seem to appreciate that there is a big world outside the US!

Brian:

The facts are that there are several KNOWN earthquake faults in the immediate area and one directly bisects the Hollywood rail line. As shown on the "Seismic Risk Map of the Untied States", Hollywood is deep within a "Major Risk Zone". It is clear that buildings and structures will quake above when the strata BELOW is unstable and in motion.

To be sure, governments build 'sensitive' vaults underground, but at issue here is a whole rail system, knowingly built within a fault zone. Perhaps it's called the Green Line because of major cost over-runs? Or was it because of the moss growing where cracks are forming? Even the bible said that the wise man builds his house upon the rock, not within.

As for patently insane statements, yours, ..." Underground is the SAFEST place to construct a rail line; earthquakes cause very little stress underground"...speaks for itself. I would remind you that AT fault lines (and elswhere) the ground can separate and shift sevral feet at a time during earthquakes. Do the terms "thrust sheets" or "fault planes" ring any bells with you? How about 'rift zones', downthrown or upthrown blocks? Possibilities of this the type of activity and damage is greatly multiplied at known fault lines! Man, this is basic junior high school stuff.

Even now, structures above the line on Hollywood Blvd. already have foundations cracking as well as outer-walls; caused by poor design, undermining, cheating contractors and construction efforts. Taxpayers ARE paying for damages and will continue to do so indefinitely! The fact is, that the Green Line Rail system has yet to experience any major seismic waves. The project is falling in on itself WITHOUT any stress added by earthquakes. Now imagine the damage when the earth really begins to rock and roll?!

I've experienced many earthquakes, living here in Southern California all of my life and have seen filmclips of streets jutting up, broken like moon pies. Busted major sewer and water lines, etc. Don't forget, the rail line is not 200' below, but just below street level. To imply that earthquakes don't change underground strata shows the full depth and value of your beleifs.

My prime objections to the rail system remain. The Green Line is NOT compatable with any other line in Los Angeles. That planners would even consider such a foolish, costly adventure as a underground rail

system at all - is outragous. The project is obscenely WAY over budget and far behind schedule. What folley to burry the rail system where known earthquake faults exist and where a monorail system could have and should have been installed years sooner, at much less expense!

At this point, I promise to try my best to not respond to you again. We have both stepped beyond the focus of these Newsgroups. I apologize for holding the soapbox for so long, but did you know not one of the three rail lines in Los Angeles goes to L.A. Airport?!... and apparently never will. <BG>

Hello!

If this article is in the wrong news group please ignore it,
otherwise
==========
I've got some awesome news that I think you need to take
two minutes to read if you have ever thought "How could I make
some serious cash in a hurry???" , or been in serious debt, ready
to do almost anything to get the money needed to pay off those
bill collectors. So grab a snack, a warm cup of coffee, or a glass
of your favorite beverage, get comfortable and listen to this
interesting, exciting find!
Let me start by saying that I FINALLY FOUND IT! That's right!
I found it! And I HATE GET RICH QUICK SCHEMES!! I hate those
schemes like multi-level marketing, mail-order schemes, envelope
stuffing scams, 900 number scams... the list goes on forever. I
have tried every darn get rich quick scheme out there over the
past 12 years. I somehow got on mailing lists for people looking
to make money (more like 'desperate stupid people who will try
anything for money!'). Well, when I was a teenager, these
claims to 'get me rich quick' sounded irresistible! I would shell
out $14.95 here, $29.95 there, $24.95 here, and another $49.95
there. I had maxed out my new Circuit City Card AND my Visa...I
was desperate for money!! So, I gave them all a chance but
failed at every one of them! Maybe they worked for some people,
but not for me. Eventually, I just tossed that JUNK MAIL in the
trash when I got the mail. I recognized it right away. I can
smell a money scam from a mile away these days, SO I THOUGHT....
I thought I could sniff out a scam easily. WAS I WRONG!!
....I LOVE THE INTERNET!!!

I was scanning thru a NEWSGROUP and saw an article stating to
GET CASH FAST!! I thought..."Here on the Internet?? Well, I'll
just have to see what schemes could possibly be on the internet."
The article described a way to MAIL A ONE DOLLAR BILL TO ONLY
FIVE PEOPLE AND MAKE $50, 0000 IN CASH WITHIN 4 WEEKS! Well,
the more I thought about it, the more I became very curious. Why?
Because of the way it worked AND BECAUSE IT WOULD ONLY COST ME
FIVE DOLLARS (AND FIVE STAMPS), THAT'S ALL I EVER PAY....EVER!!

Ok, so the $50,000 in cash was maybe an tough amount to reach,
but it was possible. I knew that I could at least get a return
of $1,000 or so. So I did it!! As per the instructions in the
article, I mailed out ('snail mail'for you e-mail fanatics) a

single dollar bill to each of the five people on the list that
was contained in the article. I included a small note, with the
dollar, that stated "Please Add Me To Your List." I then removed
the first position name of the five names listed and moved
everyone up one position, and I put my name in position five of
the list. This is how the money starts rolling in! I then took
this revised article now with my name on the list and REPOSTED IT
ON AS MANY NEWSGROUPS AND LOCAL BULLETIN BOARD
MESSAGE AREAS THAT I KNEW. I then waited to watch the money
come in...prepared to maybe receive about $1000 to $1500 in cash or
so....
But what a welcome surprise when those envelopes kept coming in!!!
I
knew what they were as soon as I saw the return addresses from
people
all over the world-Most from the U.S., but some from Canada, even
some from Australia! I tell you, THAT WAS EXCITING!! So how
much did I get in total return? $1000? $5000? Not even!!! I
received a total of $23,343!!! I couldn't believe it!!

I now have a brand new black Acura Integra to speak for, due
to this!! Now after almost 8 months, I am ready to do it again!!!
So maybe it was possible to get $50,000 in cash, I don't know,
but IT COMPLETELY DEPENDS ON YOU, THE INDIVIDUAL! You
must follow through and repost this article everywhere you can think

of! The more postings you achieve will determine how much cash
will arrive in your very own mailbox!! It's just too easy to
pass up!!!

Let's review the reasons why you should do this: The only
cost factors are for the five stamps, the 5 envelopes and the 5
one dollar bills that you send out to the listed names by snail
mail (US Postal Service Mail). Then just simply repost the
article (WITH YOUR NAME ADDED) to all the newsgroups and local
BBS's you can. Then sit back and, (ironically), enjoy walking
(you can run if you like! :o) down your driveway to your
mailbox and scoop up your rewards!! We all have five dollars to
put into such an easy effortless investment with SPECTACULAR
REALISTIC RETURNS OF $15,000 to $25,000 in about 3-5 weeks! So
HOLD OFF ON THOSE LOTTERY NUMBERS FOR TODAY,EAT AT
HOME TONIGHT INSTEAD OF TAKEOUT FROM McDONALDS AND
INVEST FIVE DOLLARS IN THIS AMAZING MONEY MAKING SYSTEM
NOW!!! YOU CAN'T LOSE!!

So how do you do it exactly, you ask? I have carefully
provided the mostdetailed, yet straightforward instructions on
how to easily get this underway and get your cash on its way.
SO, ARE YOU READY TO MAKE SOME CASH!!!?? HERE WE GO!!!

*** THE LIST OF NAMES IS AT THE END OF THIS ARTICLE. ***

OK, Read this carefully. Get a printout of this information,
if you like, so you can easily refer to it as often as needed.

INSTRUCTIONS:

1. Take a sheet of paper and write on it the following:
"Please add my name to your list". This creates a service out
of this money making system and thus making it completely legal.
You are not just randomly sending a dollar to someone, you are
paying one dollar for a legitimate service. Make sure you
include your name and address. I assure you that, again, this
is completely legal! For a neat little twist, also write what
slot their name was in: i.e. "You were in slot 3", Just to add a
little fun! This is all about having fun and making money at
the same time!

2. Now fold this sheet of paper around a dollar bill or other
equivalent

money (can be foreign),(no checks or money orders), and put them
into an envelope and send it on its way to the five people listed.
The folding of the paper around the bill will insure its arrival to
its
recipient.
THIS STEP IS VERY IMPORTANT!!

3. Now listen carefully, here's where you get YOUR MONEY COMING
TO YOUR MAILBOX. Look at the list of five people; remove the
first name from position one and move everyone on the list up
slot one on the list. Position 2 name will now move to the
position 1 slot , position 3 will now become position 2, 4 will
be be 3, 5 wil be 4. Now put your name, address, zipcode AND
COUNTRY in position 5, the bottom position on the list.

4. Now upload this updated file to as many newsgroups and local
bulletin boards' message areas & file section as possible. Give
a catchy description of the file so it gets noticed!! Such as:
"NEED FAST CASH?, HERE IT IS!" or "NEED CASH TO PAY OFF
YOUR DEBTS??", etc. And the more uploads, the more money you
will make, and of course, the more money the others on the list will

make too. LET'S ALL TAKE CARE OF EACH OTHER BY BEING
HONEST AND BY PUTTING FORTH 120 PERCENT INTO THIS
PROFITABLE & AMAZING SYSTEM!!! You'll reap the benefits, believe
me!!! Set a goal for the number of total uploads you'll post, such
as
15-20 postings or more! Always have a goal in mind!!! If you can
UUE
encode the file when uploading, that will make it easier for the
people to
receive it and have it downloaded to their hard drive. That way
they get a copy of the article right on their computer without
hassles of viewing and then saving the article from the File menu.

Don't alter the file type, leave it as an MS-DOS Text file. The best test is to be able to view this file using Microsoft's Notepad for Windows 3.x or WordPad for Windows '95. If the margins look right without making the screen slide left or right when at the ends of the sentences, you're in business!

5. If you need help uploading, simply ask the sysop of the BBS, or "POST" a message on a newsgroup asking how to post a file, tell them who your Internet provider is and PEOPLE WILL ALWAYS BE GLAD TO HELP. I would try to describe how to do it but there are simply too many internet software packages with slightly different yet relatively simple ways to post or upload a file. Just ask for help or look in the help section for 'posting'. I do know that for GNN, you simply select 'POST' then enter a catchy description under the subject box, choose 'ATTACH', selecting 'UUE' and NOT 'TXT', then choose 'Browse' to go look for the file. Find your text file "MYFILE.TXT" and click on it and choose 'OK'. Place a one

line statement in the main body section of the message post screen. Something like "Download this to read how to get cash arriving in your mailbox with no paybacks!" or whatever. Just make sure it represents its true feasibility, NOT something like... "Get one million dollars flooding in your mailbox in two days!" You'll never get ANY responses!

6. And this is the step I like. JUST SIT BACK AND ENJOY LIFE BECAUSE CASH IS ON ITS THE WAY!! Expect to see a little money start to trickle in around 2 weeks, but AT ABOUT WEEKS 3 & 4, THE MONEY STORM WILL HIT YOUR MAILBOX!! All you have to do is take it out of the mailbox and try not to scream too loud (outside anyway) when you realize YOU HIT THE BIG TIME AT LAST!!

7. So go PAY OFF YOUR BILLS AND DEBTS and then get that something special you always wanted or buy that special person in your life (or the one you want in your life) a gift they'll never forget. ENJOY LIFE!

8. Now when you get low on this money supply, simply re-activate this file again; Reposting it in the old places where you originally posted and possibly some new places you now know of. Don't ever lose this file, always keep a copy at your reach for when you ever need cash. THIS IS AN INCREDIBLE TOOL THAT YOU CAN ALWAYS RE-USE TIME AND TIME AGAIN WHEN CASH IS NEEDED!

****
****
THE NAMES LIST THE NAMES LIST THE NAME LIST
****

****

NOTE:
Try to keep a list of everyone that sends you a dollar and always keep
an eye on the local postings of this file... Just to make sure that
everyone is playing the game fairly. You know where your name should

be.....

*** AGAIN, HONESTY IS THE BEST THING WE HAVE GOING FOR US ON THIS
PLAN.

*** By the way, if you try to deceive people by posting the messages

with your name in the list and not sending the money to the people
already
included, you will not get much. I know someone who did this and
only
got about $150 (and that's after two months). Then he sent the 5
bills,
people added him to their lists, and in 4-5 weeks he had over
$10000!
All the
lists are re-distributed as soon as the money is received.

[Lots of arguable stuff deleted]

Does anyone dare consider that the scanning convention went bust because
it was badly managed, the organizers unskillful in selling booth space to
exhibitors, and the conference schedule utterly banal? I've seen the ads
for years and never once had the slightest desire to get on a plane, book
a hotel room and pay the exhibition/convention fee. What, so I can hang
out with a bunch of guys who want to play "find the bug with my scanner"
or listen to a sales pitch from some droid in a booth? Let's face it, that
kind of money is better spent on a new scanner, camcorder or even on a
small motorcycle. The show organizers weren't not offering a product or
service that was sufficiently attractive. Period. Blame the economy,
industry greed, blah-blah-blah, but if you overlook the fact that the
appeal of the event was marginal at best, then you're missing the point.

I just picked up 2 of them with date code 11A3 cut the L201 and got full cellular. I like the Pro 2030, the price was great too 69.00 at Radio Shack on a close out if you can find 1 get it, even if the date is newer at that price its a great scanner.
I also have the Pro 26 that is a very nice scanner too.

> one convention to have anything new to say.....

I think you missed my point. There is a bigger picture here than the failure of one convention. Many of the issues that I named will have a major impact on the future of the Internet as well. Are you aware of the VON controversy, for example? There is a(nother) case of big money corporations trying to make sure that NOBODY else gets a piece of "their" pie.

> electronic signal. When I became involved with scanning in the 1970's
> I can remember being cautioned even then that I could not use the
> information I heard for my own profit...Whats changed?

You are no longer permitted to exercise your freedom of personal responsibility for your own actions. Anything that might step on anyone's toes is being legislated against, even if your commission of any of those deeds on any particular occasion harms nobody.

> This is something which I agree is affecting the scanning hoby...
> However it is a long term trend not affecting all hobbists in all
> communities...
I think you just contradicted yourself, but I could just be tired...

> Notice that many of our fellow scanner owners are
> beginning to work out methods of decoding these signals. Drop by the
> optoelectronics booth some time and see whats being done there, or try
> looking at the software decoding schemes being sold which use the dsp
> capability of sound cards to decode various digital services.

But what if ECPA et al are interpreted literally by the courts? Then these hobbyist efforts to decode digital paging systems will be illegal. Who needs scrambling to kill the hobby? All you need now to render a scanner useless under existing statute is a communications system whose "essential parameters have been withheld from the general public" for the purpose of "privacy". (Actual wording of ECPA.)

> death to our hobby will occur when the transmissions are heavily
> scrambled not just digitized.

Or when the courts decide it is dead. See above.

> >R&D costs, or the fact that scanner manufacturers are the same companies that are
> >building and selling the new "scanner-proof" radio systems. Remember what happened
> >with the Radio Shack PRO-2004?)

> What was that I guess I missed "what happened'

The PRO-2004 was designed, built and advertised as a continuous coverage receiver with no gaps. Then ECPA was passed and Tandy Corp realized that one of their own products made a mockery of the law that they, Tandy, had helped to buy from Congress. So the '2004 was kept off the market for a few extra weeks while the engineers figured out how to "block" reception of the cell bands. Hence the famous "clip-a-diode" cellular mod.

> The processes for
> following trunked systems exist... But the cost to design them and
> bring them to market is always an issue.
And their legality is another potential issue. If you controlled a big corporation with a major R&D budget, would you risk a few megabucks to develop a receiver that may at some future date be forced off the market by some government-mandated change in the certification requirements?

> > I took almost 40 copies of the "Scanner Master Upstate New York Guide" to the
> >Rochester (NY) Hamfest this weekend. The regular cover price is $29.95 plus tax. I was

> How many copies of percons CD-ROM covering the entire US at 29.95 were
> sold?.. The same data is in there....

I'm not going to get into advertising here, but nobody's CD-ROM has "the same data" as any decent scanner book. Where on a CD can I find unit number tables and system usage details assembled by local listeners and dispatchers?

Now I'm not saying that the CD-ROMs or FCC databases on disks are not useful scanning tools. Far from it! But they are only a starting point.

> OK so the convention was cancelled. Was there hundreds of new products
> being brought out this year? Is there a new focus in scanning that is
> breaking right now that everyone wants to find out about?

Don't you see the lack of any major "new thing" in scanning to be a problem? If the hobby/industry is in a positive mode, it should look just like the Internet connectivity industry looks.

> If you see the indudtry dying... Then for you it is.. But then again
> maybe you need to see what business it is that you are in... Do you
> sell books of frequencies, or are you part of the nationally growing
> communications industry?

Most people in any kind of business are there to make money. If there is no money to be made, we aren't going to be buying very many groceries with the fancy new name that we decide to call our industry by.

That reminds me of an episode of "Murder, She Wrote" a few years back
where the "bad guy" planned his murders around listening to the local
police on a 1940's Zenith radio which picked up the old police band right
above the broadcast band.

Just shows that television producers don't always know every detail of
reality, especially police scanner frequencies. :-)

In Australia we have the same 27 Mhz CB as USA and 40 channels on UHF.
The UHF is from 476.425 to 477.400 with max power of 5 watts using FM.
Repeater outputs are on channels 1 to 8 with inputs on channels 31 to 38.

->be appreciated.
->
->Kind Regards,
->
->Donal.
->01.06.96.
->
Donal,
Try the Fleet common freq. 277.800 AM.
Also check your area marine freqs. For instance, when the JFK was in NYC last week, all the ships were heard on the NY ship traffic freq. 156.700.
If they have any helos launched for demonstration, try helo tactical 242.400 AM.
When docked, try 142.305 and search 139-143 mhz for SP's. Some *may* be encrypted however. There is not a lot of two way radio transmissions when docked in any case.
Have fun if you tour the ship. We got a personal tour in NY...bridge etc., and it was great!

Roger W. Wobig (wobig@umich.edu) wrote:
: Hello,
: If someone has them handy, please email or post these frequencies. I
: didn't see them in the operator's manual.

The first IF is at 275.45Mhz, I don't know exactly where the second one is, the third one, of course is at 10.7Mhz/455Khz. Since this is a wide range reciever, I would not expect these freqs to be consistent across all bands.

Images can be picked up at 2x the first IF, or 550.9Mhz, above the actual frequency.

There are two manufacturers of wireless headsets for Drive-Thrus:

Panasonic
3M (marked as GM on heasets)

Both operate as a half-duplex system and use a PL Tone to communicate
with other employees internally and a PL Tone to commuincate with the
customer at the drive-up speaker.

The older Panasonic and 3M systems transmit a constant carrier on the
speaker frequency (repeater).

The newer Panasonic systems only transmit a carrier on the speaker
frequency if a car is present at the drive-up speaker.

Check out the following URLs for a list of frequencies that they operate
on:

249. Olympic Torch Relay/Chicago

Newsgroup: rec.radio.scanner
Date: 1996-06-04 00:00:00 UTC
From: unclebob@ripco.com
Message-ID: <DsGL6p.F2E@rci.ripco.com>
Source record: 232458

The Olympic Torch Relay came through Chicago today. It was quite exciting and the runner that carried the torch by me had a look of extreme elation on her face. I was able to keep track of the event by tuning in to the Chicago Police "Citywide 6" frequency for special events. It was an easy choice. Two freqs (469.3625 and 469.5000) offered in a recent post to this newsgroup for the "Caravan Control" didn't pan out, however. If the Torch is coming to your town, keep tuned to your local municipality's special events frequency and you should be well-informed about the relay as it happens.

Program these Freqs. into your scanner with NO delay and see what
happens:
860.7125, 860.4875, 859.7125, 859.4875, 858.7125, 858.4875,
857.7125, 857. 4875, 856.7125, and 856.4875Mhz.
One of the Freqs. above will be a data channel (annoying sound!!), lock it
out and just scan the other 9 Freqs. the Data channel might change
from day to day but just lock out the new data channel and unlock the
old one. If you don't here anything from any of these freqs. your
City might have gone *digital* and you won't be able to hear anything...
Hopefully the trunked system is *analog* and you won't miss an exciting
call!! BTW: during the day you will hear everybody from Garbagemen to dog
catchers on the system, but at night only police, fire, and rescue...
Let me know if I can be of further assistance...

Has anyone found any sign of actual operating systems on this band re-
allocated from amateur use about 5 years ago? The FCC did set up some
regional/nationwide licensing schemes several years ago - curious if
any have been granted or are actually in use.

> don't think there is actually any formal definition.

Actually, the terms are defined by international treaty, currently the
"Radio Regulations" (Geneva, 1982). In english, MW is 'medium-wave'. The
proper designations for the bands are:

```
Freq. 30kHz 300kHz 3MHZ 30MHz 300MHz 3GHz 30GHz
VLF | LF | MF | HF | VHF | UHF | SHF | EHF
| | | | | | |
Band <--4----|---5----|---6----|---7----|----8----|----9---|---10---|---11-->
| | | | | | |
Wave- | lw | mw | sw | | | |
length 10km 1000m 100m 10m 1m 10cm 1cm
```

After using up the adjectives very/ultra/super/extremely, they gave up and
band 12 (300-3000 GHz) has no name. The bands below 9 kHz (the lowest freq.
subject to treaty) are usually refered to as ELF.

>Has anyone tried out the new Optoelectronics Optolinx 'unversal interface'
>yet? I am thinking of buying one to hook up my AR8000 to my Mac.
>
>

I bought one at the Dayton Hamfest. It worked great for about an hour. I had three devices plugged into it, an Icom R7100, an Icom R7000, and a PRO-2006 with the OptoScan 456 board. Using Scan*Star Commercial software, I was doing various master/slave relationships with the radios and Optolinx, when suddenly the two Icoms quit working. I found that if I unplugged one of the Icoms from the Optolinx, the other would then work. Neither one would work if I left them both hooked up to the Optolinx. The 2006 is unaffected. Choice of ports doesn't matter either. My AR8000 worked fine prior to when the "problem" surfaced, now the Optolinx won't talk with the AR8000. A call to OptoElectronics was futile, they said they didn't know what the problem could be, but was sure it wasn't the OptoLinx. I then tried the same thing with another piece of software (ScannerWear), same problem when both Icoms were plugged in. The guy at Opto told me they don't check it out with all the ports used, they only check it out with one radio at a time.... Maybe that's something they need to do. It's going back later this week.

'Er, aha, pardon me, but...

No one OWNS any frequency. Frequencies are applied for and if
approved, assigned for limited use.

NABERS (a bull*hit ~ FCC approved private company) reviews/approves
most business band applications and they supposedly monitor channel
load, number of licensed transmitters, power requirements/requests and
then a decision is made.

In the case of the motion picture industry, a number of frequencies
are set aside for that specific use, but on a licensed/shared basis.
Again, no one owns any frequency. Even the FCC has it's channels
assigned to them by NITA/IRAC.

Source record: 232467

Yes, you are correct. 154.905 IS the 'mobile' input to the
'extender' receiver in the trunk. My list shows 39.140 as the OUTPUT
for the extender (?!) ~154.905. Perhaps this would be the
better/stronger frequency to monitor?

A PorCon SPECTRUM 96 shows:

39.140 ~ KA4993, CHP, 9,525 vech. and 5,200 portables.
also many licenses for fixed locations/district
offices, same frequency.

Hummm? Think I'll check it out for a few days...

>
> Thanks!

Dave,

What it says is this, Arlington PD and FD have 10 frequencies avaiable. Usually, one will be the control
signal, and all you'll hear is a buzzing sound. Program all ten, and lock out the buzz channel. Once a day or
so, they may change the control channel, so you'll have to lock out the new control channel, and unlock the old
one.

The Freq's to program are (These are the base frequecies):
856.4875, 857.4875, 858.4875, 859.4875, 860.4875,
856.7125, 857.7125, 858.7125, 859.4875, 860.4875.

The mobile units are transmitting on:
811.4875, 812.4875, 813.4875, 814.4875, 815.4875,
811.7125, 812.7125, 813.7125, 814.7125, 815.7125.

I'd suggest program the base, and see if you hear the mobiles. Sometimes the base repeats the mobiles.

Have fun,
Steve

Hi folks!

I read the discussion about the CE-232 board vs. the OS-456. I haven't seen this board advertised before. Anyone have operation specifics or a source?

Second, This Standard 5900DA mobile looks like a GREAT Ham Transciever/Scanner with Tri band (6m, 2m, 70cm) coverage, Wide band recieve, (VHF Lo,Hi, UHF, Mil Air, 800, (no cell of course) AM, FM-N, FM-W and 200 channels.) Has anyone got a chance to look at this radio yet and/or have any report on it? I understood it was supposed to be out last month with around a $850 price tag (not too bad considering what you get), but nobody seems to have it yet..

I got lots of great help about the message trakker problem (Thanks) and I believe it has to do with my computer.. I had better success with an old 286.. The guy from KLT said the "timing" of the machine had a lot to do with it...

Enough bandwidth on my part.. Thanks!
73's!

Reluctantly, I must sell my Standard 708 scanner. This is the one with the Panadaptor display. It has 100 memories, scans all the memories, some of the memories, band segments, etc. It is nothing like the FRG9600, which is a poor excuse for a scanner. It is different from most scanners, though. It covers 50-905Mhz, NO GAPS. It does AM, FM and Wide FM. You can put it on a frequency and look at the display and see any transmissions 500Khz up or down from the center freq. It is great to find new freqs in your area. It is compact and solidly built, a really premium radio. There is nothing else on the market like this. It is actually billed as a bench test receiver. Retail cost is/was $799 or thereabouts.

$550 shipped.

Has anyone found an alternate battery pack for the 2500XLT's?

It would be great to have an alternative to the basic Nicad.

I was watching that show as well. The guy was listening to the police
with
a scanner mounted on his dash, and of course he had it tuned to the
local police
frequency of 162.550! Didn't know the cops had finally taken over the
local NOAA weather office!!

If the question is will it work with the AR8000, yes. I would think it would also work on the mac, the problem is you'll need to get software to use for scanning, uploading and downloading information.

The only thing you should need to do is grab a gender changer from 9pin db to the mac serial port.

F.Y.I. the PerCon CD "SPECTRUM~96" will do all of the items below except those with a " * " (as listed below), but the cost is only $24.95+ for ALL states. I doubt if most scanning fans would miss those " * " options very much, considering the real needs and cost differential.

In IMHO, SPECTRUM~96, with 3,000,000+ license listings is a much better buy including many search engine options.

I have the Scout and have used it with the R7100 on an Icom made CT-17 interface. If the Scout is plugged in and NOT powered on, then it will apparently lock up the interface. Solution - either power the Scout on or disconnect it from the interface. I suspect when not powered it grounds the interface lines. I would also suspect that other Optoelectronics products have the same "feature".

>disappeared.

I found it thanks but I can't beleave my eyes. They still have the
largest city (TORONTO) listed incorrect it changed years ago from
162.475 to 162.400 I don't trust Enviornment Canada. How can such
a error go un detected for such a long time.

Another thing, looking at the weather web pages on the WEB Canada
SUCKS. What a slap in the face. Even our Department of
Communications or Communications Canada can't put a better web
page together. I also see that no one in both departments
returns email.

Thanks for all the replys. I gather there are an offical
5 frequencies or was it 6...anyways seeing that the very first
listing I looked at from enviornment canada (toronto) was wrong
I'm still looking for a more up to date listing. I think I'll
phone the weather office and see what I come up with.

I emailed discrovery and told them what I thought. Others should
do the same.

I told them about this newsgroup (I'm sure they don't know about it)
It seems that they really do not know what they are talking about.
Anyone knowing anything about scanners would not have made those
mistakes. I would say their creditably is at great risk.

If such errors were made, then how about the other programs. Is the
same type of reseurch made?

What should a scientist do if he has a discovery that can bring immense benefit to the world but on the other hand, can destroy the world totally?

Few of us have to make the above decision. Prof. Yull Brown is one of the rare few who has to make such a decision. Should he share his discovery with the world? Should he just tell the world the beneficial side? If he does that, would the "evil part of the human mind" from many other scientists figure out the destructive side?

Many of us can laugh at the above scenario and say, "That is not my problem. It is fortunate that I am stupid and never need to make such a decision." Prof. Brown is facing such a scenario. Whatever he does will be praised by some and cursed by many.

His dilemma is being shared with the scientists who talked with him, read his articles, saw his experiments. There have been hundreds of brilliant minds who saw the demonstrations. In the demonstrations, only the beneficial side was stressed. However, it was obvious that such a powerful discovery could also destroy the world.

Within 24 hours of seeing the demonstration, a person such as I with a degree in Physics but have not designed any nuclear weapons have figured out how to create a "cheap" nuclear bomb. A certain part my mind just could not resist the temptation.

When the world is still bent on killing and hurting each other (e.g. Middle East), such knowledge can be very dangerous. The US Government is trying its best to stop the spread of nuclear weapons. However, what happens if that knowledge is well known and the raw material is easy to get. Should the US Government suppress such knowledge wiping out all the benefits that such a knowledge can bring to the human race?

This is no longer a what-if question. This is REAL. Prof. Brown has been facing such a dilemma. His supporters (including myself) and the US Government are all facing the same dilemma now. Within our little heads, we have the knowledge to benefit or to destroy the entire human race.

The Prayer

I do not normally pray for Divine Guidance. In this situation, I did. The message came loud and clear - Share the secret with the world &

Promote Peace at every Opportunity.
The secret can be found in:
http://www.primenet.com/~ltseung/brown1.htm

Please spread the information and the message of peace to the best of your capabilities. Thank you.

The data is transmitted in 1200 baud MSK. I'm not shure of the
word/packet length. Frequency is 173.075 MHz.

I've heard that in Canada it sends "Here piggy piggy" in 2wpm morse on
27.185 MHz.

Transmitting on the 480Mhz range would be illegal without a license.
These frequencies are used by both UHF TV stations and in some areas for
special purposes.

Perhaps you mean the 460Mhz band. Here, you can get a license for
business use, or for General Mobile Radio Service. Very low-powered GMRS
can be used without a license.

You are right, cordless phones are a much bigger security risk than cellular. First of all, all scanners tune them in. Also, you get entire conversations, and most of all you can target a specific person quite easily, just go near where they live.

I think Discovery should not be totally bashed for a few small mistakes. Maybe they ought to be lauded for making the public aware and stating the plain truth that anyone who uses a phone with an antenna on it can be overheard quite easily by someone who wants to.

Besides, when they were doing the show, perhaps they had a recently purchased scanner which does not tune to cellular frequencies, so they just set it to 49Mhz because they had to set it somewhere.

Does anyone have any suggestions that I could do to fix it?

Radio shack wants too much to look at it.

All help is appreciated. Thanks.

If so, did you have a problem with customs?

(since their scanners are cellular restored)

Thanks for the info!

I got a 20-006 from Radio Shack. It is a lot better than the one that came
with the unit.

Hummm, never tried that aluminium foil stuff! Got any schematics for
the hat? Sounds like it might work!! 8-)

In terms of black helicopters, they don't know where Georgia is so we're
not bothered with them. I understand the northeast has a few flying
around, though. But I plan on staying here in Atlanta where the bass
fishing is good and the scanner listening in a few weeks is going to be
out of this world.

I use the optolinx and am pleased with it. I use it to download my scout too. I am using the AR8000 tool kit 1.1.1, you can down load it from the web, and it works fine. It is limited and only allows you to send or read data bank and system data and some of the 8k system settings. If you want to control it from a computer then as far as I know you have to go to a PC. On the Mac I use a standard Mac serial cable the same one that goes to my modem. This is a DB25 at the modem end so I use a DB25 to DB9 converter and it all works fine. I here that there is a wiz-bang Mac program coming out this summer.

: I think Discovery should not be totally bashed for a few small mistakes.
: Maybe they ought to be lauded for making the public aware and stating the
: plain truth that anyone who uses a phone with an antenna on it can be
: overheard quite easily by someone who wants to.

: Besides, when they were doing the show, perhaps they had a recently
: purchased scanner which does not tune to cellular frequencies, so they
: just set it to 49Mhz because they had to set it somewhere.

I agree with the above. My guess is that they knew the difference, how could they not? But for some reason, cosmetic, equipment failure, glare etc., they decided that 95% of the folks watching wouldn't know the difference anyway and used what they had to illustrate the point.

I saw a program on Nat'l Geographic once about how they make wildlife documentaries and it really opened my eyes. What appears to the viewer to be a seamless run is actually hundreds of short disconnected takes with a completely artificial soundtrack all in the name of the higher truth of educating the viewer, I suppose. The 5% of us that know the difference are supposedly already educated and can be ignored.

> Photographer, The News-Item

Well, 133.8875 is actually in the AM Aircraft band, the chance that your
police is there is probably slim. Now depending on your scanners IF you
can figure out the spacing of your images.

For example, if your scanner has an IF of 10.7 like mine then your
images would be 21.4 Mhz higher or lower. (IF of your scanner) x 2
So the sctual freq you would be listening to is 155.2875 (in the
police/public safty band) or 112.4875 which is still in the Aircraft
area.

These freqs all depend on your IF freq. You can find it in the
instructions for your scanner or on the scanner itself. If you need
help finding it I'm sure someone on here has the same scanner.

Good luck..
Eric Hammersley

This list floated around on FIDO for awhile...I cut the headers off, so
apologies to the originators.

If your shopping mall is not listed below, try scanning (MHz):

151.625 to 151.955 154.515 to 154.60
457.5125 to 457.6125 460.65 to 462.1875
462.75 to 462.775 463.20 to 464.9875
465.65 to 467.1875 467.75 to 467.925
468.20 to 469.975 851.0125 to 865.9875

Following the shopping mall list is a list of nationwide stores and their
security frequencies.

```

Nope, at least not on it's on. Theoretically, it would be possible to hack on to it to add those capabilities, but would require both hardware and software hacking. I'm sure the microprocessor in the CE-232 is capable of much more than it's doing.

Hmm--not only does Min Ni (apparently since GSU.EDU is in Atlanta) post pyramid scam chain letters from her (?) state university account but she (?) cheats on the rules and puts her name as #3.

I hope she doesn't do something similar on her tests. Maybe her postmaster can advise me.

"This brand new, high-tech scam is as old as Methuselah," said Jodie Bernstein, Director of the FTC's Bureau of Consumer Protection. "Behind all the techno-jargon and the mathematical mumbo jumbo, this is just an elaborate, electronic version of a chain letter. People are told that if they sign up and send money, they'll eventually end up at the top of the pyramid, collecting from those at the bottom. But most people never make it to the top. Early entrants may make some money, but eventually, the pyramids collapse and most of the 'members' are left holding the bag," she said.

==========
I've got some awesome news that I think you need to take
two minutes to read if you have ever thought "How could I make
some serious cash in a hurry???" , or been in serious debt, ready
to do almost anything to get the money needed to pay off those

bill collectors. So grab a snack, a warm cup of coffee, or a glass of your favorite beverage, get comfortable and listen to this interesting, exciting find!
Let me start by saying that I FINALLY FOUND IT! That's right! I found it! And I HATE GET RICH QUICK SCHEMES!! I hate those schemes like multi-level marketing, mail-order schemes, envelope stuffing scams, 900 number scams... the list goes on forever. I have tried every darn get rich quick scheme out there over the past 12 years. I somehow got on mailing lists for people looking

Does anyone have a recommendation for a good, <$500, new handheld scanner that can be modified for cellular? I have read that anything made after April 1994 can't be modified, but I don't know if that is a hard and fast rule with all makes. If late models can't be modified, are new models that are modifiable available overseas (such as U.K.) that can be shipped here?

: I'm looking for the offical list of what areas are covered by
: what frequencies for Ontario and/or Canada etc.

: eg Toronto CN Tower 162.400

: How about everywhere else??!!

Ron, Environment Canada uses 162.400 to 162.550 khz in .025 khz steps for WeatherRadio Canada. The frequencies to the east include 162.550 in Peterborogh and 162.400 in Omeemee (P'boro repeater). I live right on the line, so I get Omeemee and not Toronto on my scanner.

There was a complete list of WeaterRadio Canada stations, frequences and even a map at the Environment Canada web site, but it seems to have disappeared.

BTW, that Omeemee repeater has been around for a year, but no one seems to document it.

326. newbie question about what kind of equipment I need: please help!

Newsgroup: rec.radio.scanner
Date: 1996-06-05 00:00:00 UTC
From: mlevin@husc7.HARVARD.EDU
Message-ID: <4p2jdf$2nb@decaxp.HARVARD.EDU>
Source record: 232383
Cross-posted to: alt.radio.scanner,rec.radio.scanner,rec.radio.shortwave

I am interested in buying a piece of equipment which would let me listen in on as many things as possible, including: regular radio stations, TV sound (UHF and VHF), short-wave (broadcasts from other countries), police/fire/airplane broadcasts, etc. Is there any single unit I can buy (preferably for under $300) that would tune them all in? Or, do I need two separate units (a scanner and a short-wave receiver, for example)? What are some general guidelines for features to look for, how much should I expect to spend, and where should I get it (mail-order, retail, etc.)? Any advice would be greatly appreciated. Please email to mlevin@husc.harvard.edu.

How long to install?? What does the software exactly do??

Have one made for a bag phone??? I really don't want to do all that work to my 2006's.

Get a up to date price on CCS's DDI.

Whats a legality??? he he.

Cordless phones are 100 times easier to listen to (almost all scanners can recieve tha tfreq range), though cellular obviously has a farther range. I live in a medium-density area of town, and just about 24 hours a day I can pick up a cordless phone. And I know that the people talking are local, whereas with a cell phone the guy could be from Mexico and just driving through.......

WOW! Its been a long time since you were able to do that! Guess that
would be about as old a trick as Angela Lansbury :)
Anyway, I was a movie once where the scanner was supposedly spewing
police dispatcher audio but a closup revealed the frequency was set to
146.79...the VHF HAM band!

PS..I've got a bunch of similar items about scanners/two way radios
being misused in movies/tv on my web page and am always looking for
additions if you want to e-mail me!

Hi Ron, great web-page BTW!

I am aware of three AES weather radio station around my area of Essex County:

162.475 out of Windsor Airport (tower is in McGregor)
162.400 out of Sarnia Airport (tower is in Oil Springs)
162.475 out of London Airport

As far as their signal coverage, when the Windsor station went on the air
7 years ago or so I wrote them and they sent me a QSL card and other neat
weather information. According to their little map on the QSL card their
coverage was most of Essex County with some fringe coverage in far
western Kent County. I think the transmitter power was 65 watts.

Hope that helps as a start!

Jeff

Isn't this supposed to be used for new narrow band radio equipment
with no more than 2 kc deviation and closer channel spacing or
something?

ML>Mike Levin

Mike:

It's not polite to ask a question on a newsgroup and then expect
personal e-mail. Some like to learn by reading other messages.

The only scanners that will do everything you want are the AR8000,
AR3000A, or the Yupitero MVT7100 (not sure on number). These all
cost much more that $300 used, let alone new. Expect to pay at least
$400 for the Yupi. The extra $200 it costs for the AR8K would be
well worth it.

It would be cheaper to get a used shortwave radio (Sony) and
nearly any other VHF/UHF scanner. The shotwave radio would run between
$100 to $250, and the scanner around $125 to $250.

Obviously selling these built would be illegal.

Selling kits may be
questionable.

Selling the copyrighted plans and board layout is commonly done for
these type of things.

I have two scanners and only one me. I need to get rid of either
my PRO43 or my PRO 26. I can't decide which one to sell so I will
just keep which ever scanner doesn't sell.

FYI -The pro 43 has been modified for cellular reception.

Both scanners are in perfect working order. The Pro43 is about 2 years
old and the Pro 26 is less than 6 months old. I would like to get
around $250 for either. I will include a Condor antenna and I will pay
for
shipping to you. Please e-mail me with any questions or offers.

If I am correctly guessing that your scanner has a first IF of 10.7 MHz,
you might try at ou about 155.2875. The frequency you gave (133.8) is in
the aviation service. If you are hearing police traffice there, it's
probably some type of image. An image will often sound like a weak
signal.

Glenn,

Read your post with much interest. Communications equipment use lot's of electronic mixing, tunning and amplification. 'Mixing' is what I suspect may be happening with your weak police signal?

When I added your signal at 133.8875 AND 21.7 (what I suspect your receiver "IF" frequency is), that gave me: 155.5875, or better yet, a target frequency of "155.58"MHz, a authorized police channel!

Next time you hear traffic on the 133 frequency, quickly switch to 155.58 and see if the traffic is the same? If so, I suspect you will hear the transmissions MUCH stronger!

I didn't find a city or state indicated in your message so I tried another CD to locate two cities with your business name as listed below.

I also found 61 licenses issued on 155.58MHz in PA for: "The Commonwealth of Pennsylvaina", law enforcement services as indicated with the 'PP' nomenclature. None were in Shamokin or Mt. Carmel.

Please let me know how you do?

73's
Uncle T.

BTW, I first tried adding 21.4 to your frequency and the result was: 155.2875 or "155.28". This channel has many assorted ambulance, a rescue team and a school district assigned there, so I was confident that 21.4 as a "IF" was out.

>Mike Miller N0JAS Des Moines, IA
>mikemiller@dsmnet.com

The sad truth is USP spent enough money to buy-off the FCC and the lower porton of the 220MHz Amature Radio band.

A two-way company convinced UPS that they could deliver technology required for package and vechicle tracking as well as two-way radio service with narrow-band split single-side-band technology. ASSB or something like that.

The engineers could not deliver the radios and UPS abandoned it's plans and the two megacycles have remaind dormant for some time. As I understand it, there has been a few assignments there, but not many.

In Los Angles frequencies are at a premium and I lost a open repeater channel pair within the above frequencies when the frequencies were lost. Now there are new rumors and plans to grab the amature VHF and UHF bands! Thanks a lot Mr. Clinton. You know where my vote will be!

Message-ID: <31b73151.13256972@news.dxnet.com>
Source record: 232266

Wow!

What an adventure! Searching for your information I found that there are no AMTRAK licenses shown in Oregon, Wa. or California!

Next I went to POLICE CALL '96, by Gene Hughes. I found 5 Amtrak frequencies as follows:

160.455 Amtrak, 160.815 (LA Switch), 160.815 (LA Road), 161.055R (Police), 452.9R (Car Inspectors).

Then I searched PerCon's SPECTRUM 96 by frequency in California and found:
NATIONAL RAILROAD PASSENGER COMPANY

Under that name I checked those three states again and found only 'hits' in California? They are as follows:

160.455, 161.055, 161.475, 452.9 and 457.9MHz

Hope this is of some help to you?

Thank you Steve...Yes, we are US oriented, yup, both were invented here...most importantly to our friends in other countries, please remember that some 85% or so of traffic on the 'Net travels within the bounds of North America, and

we quite often can't tell by looking at your addresss just where the heck another person is located. Please take this in consideration BEFORE you get all huffy and negative. I'm more inclined to respond to a positive message informing me that they are in a different country, with different radio specs. I went out of my way to give a person info they wanted based on what info I had at the time, and got a diatribe instead from someone who has a burr under their blanket...perhaps I should ignore future requests from unfamilier addresses ??? I'd really hate to do that, I'd rather respond to requests for help based on what info is presented to me AT THE TIME OF REQUEST. If you can't include important info to help me answer YOUR question, then don't bitch at me if the answer does not fit your situation...

It probably means they couldn't find a scanner that can receive the
cellular freqs, or they quickly bought a scanner of the shelf of Rat
Shack and didn't take the time to find out how to enable the cellular
freqs.

>The dicovery channel also stated that the average price for a scanner is

I don't even think low-end Opto Scout-type devices don't cost that
much, do they?

Things you see on the Discovery channel should be taken with a grain
of salt. The first episode of their new series "Wonders of Weather"
was about hurricanes. There were huge errors in fact all through the
show. It's as if they write a general script based on fact but when
they get to the details, they make them up as they go along.

I know this does not qualify as a scanner, but can anyone tell me anything about this radio? Can this be used with C-Band Satellite to receive SCPC audio?

How much should I pay for this radio in fair to good condition?

I doubt it, considering that it looked as if they were working with actual scanner enthusiasts. Also, the scanner was one of the very nice base station rigs from Radio Shack, and as far as I know those will recieve cellular with no problems. I think what happened was that they were filming a scanner enthusiast listening to cordless telephones, but they forgot about the frequencies when they compiled the show. Again, I'm surprised that cordless telephone monitoring was not brought in at all. Apparently they did know that listening to cordless telephones is possible, they taped someone listening to cordless frequencies. Maybe they didn't think it was important enough to include in the show for some reason.

The basic models can be purchased for about $200, give or take $50.

It's great to know that the information the Discovery channel is feeding its viewers is inaccurate. I should stick to watching the lions and tigers. :-)

Yea, Hollywood is pretty dumb sometimes, especially with anything technical in the movies. I always laugh when they show a MacPlus with a MS windows screen shot on it.
However, I did see scanners put in a good light on a news segment on CBS middle of the night news the other day. The story was on the fires in Alaska. The reporter was interviewing a resident about rumors of looting of evacuated houses. He asked "Where did you get your information from" to which he replied "From my scanner"
They also interviewed some lady that lived near the fireline and introduced her as someone that was keeping tabs on the fire with a police scanner. She mentioned something about listening to the firefighers as well.
Too bad it wasn't during primetime.

This message was from Pat Spencer to All
and was forwarded to you by ROGER D. CRAVENS

Hello all,

I just got off the phone with Paul Mitchell, KY ARES Section Leader, and member of a number of public safety agencies concerning the incident in Hopkinsville, KY where a juvenile was arrested for possession of a police radio, impersonating a public servant, and disordly conduct. The juvenile was detained for possession of a Radio Shack HTX-202 2 meter radio. When he presented his license, and ARES ID, he was charged with impersonating a public servant. The disorderly conduct charges where added because he disagreed with the officer.

This radio has no capabilities, or modifications to allow it to recieve any frequency other than in the amateur band.

Mitchell spoke at a local ham club meeting Monday night, and said that Tandy, and the ARRL have sent lawyers to assist the young man. He, or another club member, I forget which also stated that the arresting officer had been relieved of duty pending the outcome of this incident, and I believe another was placed on administraive duty because of the incident.

I asked Mitchell tonight if there was any information I could bring to this echo, and he stated that the County Attorney (the equivilent of a DA in Kentucky) has dropped the possession of a police radio charge. I don't have exact dates, but I do know it has been at least 2-3 years since Kentucky passed statutes to allow hams to possess radios that can receive police transmission on a mobile basis.

The young man's defense attorneys have continued the other two charges to investigate the level of training, prior complaints, and other factors involving the arresting officer. I honestly got the impression that there had been prior problems with this one officer in the past.

Futhermore, the detainment of the young man was not handled according to Kentucky Revised Statutes. Pardon the lack of legalese here, but the officer "improperly processed" the juvenile. He fingerprinted, and housed him improperly.

When the youth received his radio back, it had obvious signs of being taken apart. Mitchell advised him to send the radio back to Tandy and have them analyze it.

Mitchell has spoken to the young man, and to others in public safety agencies in the area and has the highest comments about him. He states that the young man is very mature for his age, and is not a "hot dog."

Just my own editorial comment. It is a sad situation, but it will provide a test case for amateur radio operators who possess radios that can receive police frequencies. It is an ignorant shame that the radio possessed by the young man that is not one of those radios.

Take care,
Pat Spencer

>TIA,

>Victor Trucco
>trucco@cybernw.com

This could be caused by the setting of the Squelch Control, or may be
an artifact caused by an AGC time constant set to Slow mode. If it
isn't related to these causes, your radio may have a problem.

Also, depending on your antenna, bands that reside in a frequency
range that are not "antenna resonant" will be quieter than those
frequencies that the antenna is resonant on.

Another point to consider is that natural and man-made noise may be
apparent in some bands and not in others.

Take your pick. If it is broken, do you want to sell or trade the
radio?

Steve

>there is a big world outside the US!

You have a very valid point, and this "assumed nationalism" is indeed rampant on the net.

However, if you will note that the URL of U.S. posters doesn't have a "US" suffix because it is assumed (the net started as a U.S. infrastructure after all). Only those from outside the U.S. have a country identifier. The vast majority of users ARE of U.S. origin.

Therefore, it is usually safe to assume that questions from people without a country I.D. suffix in their URL are indeed implying that the content of their question relates to the U.S. unless otherwise specifically requested.

This may be a worldwide infrastructure now, but it was designed and built in the U.S., so the natural bias remains whether you like it or not.

Besides, who in the U.S. can monitor French FM CB? Even "CB" is an American invention!

Steve

Hi
I have recently bought a Sanyo Voice Activated Microcassette Recorder.
It works fine using the vox system and built in mic, but to imrove
quality and cut down background noise I would like to hook them
together using the ear socket on the scanner (AOR 8K) and the external
mic socket on the recorder.

Is this OK to do, and will the vox still work?
or will the output on the ear socket of the scanner be to much for the
tape deck?

Also if I make a lead up, is it just a case of connecting center to
centre and sheild to sheild or is there more involved?

Cheers
Mark

I'll beat the 146.79 story. I was watching a movie on late night TV once and the police officer was in his bed listening to police calls on his scanner. The frequency shown on the scanner's display? 162.550. Nice to know that NOAA weather was also rebroadcasting police transmissions.

393. Q: Decoders

Newsgroup: rec.radio.scanner
Date: 1996-06-06 00:00:00 UTC
From: Wes Mangum <wmangum@vnet.net>
Message-ID: <31B68F66.2F80@vnet.net>
Source record: 232333

I am mainly interested in receiving/decoding and logging/saving alpha-numeric digital pager information, especially the news/sports updates that are available in larger metro areas. I am also interested in experimenting with the other types of digital data that a decoder may provide for example ACARS, RTTY, etc. I am not familiar with the type of information transmitted using these other protocols. I also think that it would be nice to receive and decode packet and morse code.

From my brief product investigation I have found that possibly the M400 would accomplish some of the tasks listed above but without a computer interface for saving a log of the messages. Another device is the M-8000 which is too costly. I want to connect this decoder device to an IBM compatible notebook computer using the serial port or the PCMCIA socket if any such thing exists. The device should also work well using the speaker/headphone jack output of a scanner radio so that direct connection to the discriminator circuit would not be required. Question: Is this a reasonable expectation for obtaining good reception for decoding? I would also like to see the cost of such a device less than $1,000.

I am familiar with the pager messages and what I may expect to to be able to read. I do have several questions about the scanner configuration. Do you setup the scanner to constantly receive one frequency that you want to reecive/decode. Is this a national or well known frequency. Or do you set up the scanner to scan a set of frequencies that are known to transmit POCSAG pager data and let the decoder decode the information once the scanner stops on one of those frequencies?

What type of messages are transmitted with the other protocols? I know that ACARS is aircraft to/from airport transmissions but what are examples of some of the messages? I would like to determine if the ACARS or other information would be the least bit interesting.

Does anyone have any ideas or recommendations for product(s) that may meet my requirements. Also the sharing of any real-life experiences of these types of decoding devices would also be appreciated. Is there any other protocols that I should look for in a decoder device and what type of data is transmitted using those protocols.

Thanks for any assistance.
Wes Mangum

ALWAYS-IN-TOUCH

If you own a pager and have Caller ID service at your home or office, now you can send your Caller ID message right to your pager! With the new "Always-In-Touch" paging unit, the telephone number which is displayed on your Caller ID box is automatically forwarded to your pager.

After your telephone receives a call the Always-In-Touch unit will dial your pager and display the number that called you. It also displays "how long" the telephone was in use when the person called.

Always-In-Touch will also call your pager and let you know which numbers were called from your home. This feature is great for owners of burglar alarms, and you can even keep watch on your baby sitter or children. After someone makes a call on your phone, your pager will display the number called, and the duration of the call!

SET-UP IS EASY: Two minutes, just place this device on your phone line, program your pager number into it, and it's ready to use!

For a free brochure call or write:

INFINITY PAGING
4425 Forbes Boulevard
Lanham, Maryland 20706

301-459-6877

*Your new unit will be warranted for one year from date of purchase.

COST: $89.95 + 5.00 S/H

>then the CE232 may be better.

While Rich is correct (regarding the CE232), he does not mention the advantages of the Opto456/535 board. The Opto board temporarily shuts down the 2006's CPU while in operation. The celluar lockout is removed, auto-detection of CTCSS and DTMF tones are provided. I believe this is the best advantage over the CE232. When the computer software is finished controlling the scanner, the scanner returns to normal operation.

IMO, the only significant advantage the CE232 has over the Opto456/535 is the ability to d/l frequencies into the radio. If you're on the go with your 2006 alot, I'd go for the CE232. Otherwise, I'd recommend the Opto456. The price wasn't issue for me, I bought a new Opto board from Optolectronics at Dayton for $199. Great Deal (Dayton special)! Now I'm just waiting for the Probe software to arrive.

408. Scanner card for PC?

Newsgroup: rec.radio.scanner
Date: 1996-06-07 00:00:00 UTC
From: Jonas Fjeld <jonasf@drammensnett.no>
Message-ID: <31B84B03.6D53@drammensnett.no>
Source record: 232198

First time on this group.. hope this isn't a question that is answered before.

I was wondering if there is a scanner card for PC's on the market? I am interested in a card which covers the high VHF band, as I wish to listen to the radio amateurs in the 145 MHz area. Typical functions would be to save all speech as sound files, easy programming etc.

I know of a radio card that serves the normal FM (88-108 MHz) frequencies, but have not seen any for the VHF bands yet.

Please reply to group, as others might be interested as well.

Thanks.

JF.

Here is a repost. There is another modification to shorten the
squelch
tail on a PRO-51 at:

ftp://kilroy.nasa.gov/pub/hamradio/Mods/tandy/pro51.mod

Hope this helps!

===

Hello fellow scanbots,

The following describes how I modified a PRO-51 to get rid of that awful beep. With this change, you won't be able to hear the low battery warning, either. I came up with this independently after failing to discover anything on the PRO-51 in the net.archives.

This procedure should void your warranty and may wreck your radio. Neither I nor my employer assume any responsibility for any damages you or anyone else may incur from this information!

==Radio Shack PRO-51 modification to remove !!BEEP!!==

This change was performed successfully on a unit coded "11A3." The CPU in this unit was marked "Uniden UC1581." Use the following information at your own risk!

Orientations are with the set flat on a work surface, LCD display facing down, with antenna BNC and knobs facing away from yourself.

As with any electronic instrumentation, remove all power and take all necessary precautions to prevent damage from electrostatic discharge (ESD).

CAUTION:

Be aware that parts of the circuitry will *still* be powered! There is a capacitor on the digital board that keeps the channel memory alive. This capacitor may contain enough energy to damage the electronics should a short occur.

Opening Case

Fortunately, this set is very easy to open. Open battery compartment and remove batteries. Remove four screws: two straddle the sticker on the back of the cabinet, two others at the upper part of the battery compartment. There are two small plastic detents at the floor of the battery compartment. They are directly downwards from the "-" and "+" legends, which are molded on an extension of the removable back. These detents will need to be unhitched to allow the back to separate from the front. Pull back off gently.

Remove RF board

The RF board is attached to the top panel, which contains the volume and squelch controls and the antenna connector. At this point, the board is essentially free and will separate from the rest of the set when the header connector at the lower right is pulled apart. This header provides electrical connections between the two boards. Lift the RF board straight out, exposing the CPU board.

Remove shield from CPU board

The metal shield is held by four screws. The same screws also fasten the board, which forms part of the keyboard, to the front of the case. Remove screws and lift the shield straight out. Remember the correct orientation of the shield. Do not allow CPU board to come out of case. DO NOT drop any hardware on to this board, nor allow the shield to contact any of the components.

Cut circuit trace

The ASCII diagram below illustrates the area covered by the lower right corner of the shield that was just removed. Cut the trace that leads to the center one of three plated-through lands. Take care not to damage any components or other traces. Do not put excessive force on board. Remove any metal particles before re-assembly.

There is a difference between having a scanner that can tune in freqs that are illegal to eavesdrop on, and making a device that is only designed to track and monitor cell calls illegally. I would like to think it would be legal to make and sell such a board, but you're definitely walking on thin ice here! I'd get some legal advice first if I were in your shoes!

Cool board.
Cool way to make yourself some money.
...But not if you get thrown in jail and/or fined thousands of dollars!

Is Scanning dead or dying? I have listened to the pundits in this hobby lament the demise of our hobby for months now. They point to a bad economy, 800MHz digital systems, APCO Project 25, frequency refarming, the Electronic Communications Privacy Act, the failure of scanner manufacturers to produce scanners capable of trunk following and/or receiving those infamous 800MHz digital signals, etc., etc. as proof .

Yes our hobby is in a funk right now but I firmly believe the hobby is alive and well. The economy is bound to get better (as soon as we elect a Republican President.....just kidding!! Let s stick to scanning) Sooner or later, Uniden, AOR, Radio Shack, etc., are going to have to produce scanners with the features we want if they want to stay in the scanner business. The first company to produce a scanner capable of decoding digital signals, following a trunked system, receiving signals on the new refarmed frequencies, etc. is going to have an enormous leg up on the competition.

What do YOU think? Let s hear your opinion.

Unless you fall lucky and see something used/secondhand scanners with UHF Airband on will cost a little more than $100.

The least expensive you will find New would be the PRO-43 where still available. Of the current RS lineup the PRO-60 is the least expensive with UHF Airband, the PRO-62 and PRO-26 the only others with UHF Airband.

On the Uniden side of things the Bearcat 3000XLT is the only model with the coverage.

Used/Secondhand you could look at sets such as the PRO-43, Bearcat 2500XLT or AR1000 but all will be in the $200+ mark.

There is a "WinRadio" card I've seen advertised in a scanner magazine
published in England. It sells for about 500 pounds (~$750) and covers 1 -
1200 MHz I believe. If you're interested, email me and I'll get the name &
number of a couple places that sell it and post it (don't have it with me
right now).

zeppelin@wctc.net (Zeppelin) wrote:

>I have a list of the 10-codes that police and ambulance use, but I
>have no idea what the 3-number codes mean. Could someone please post
>a list of them?

Police use "Signals" which are usually 2-digit codes that may differ
in each area. In my area these signals are sometimes combined with a
response code to create a 3-digit code. For example:

Response codes: 1 - No lights or siren.
2 - Lights only.
3 - Lights and siren.
4 - No further help needed.

Signal 52 - Auto Accident.

A 3-digit code of 252 would be an auto accident, respond with lights
only.

One source for signal codes is Police Call and possibly other
publications. It depend upon you location.

Years ago I ordered a kit from England that extended the range of my 7000 from
0-2000Mhz. It took a lot to install this thing but it works. It seems that by
going to HF mode and pushing the 1Ghz button I can go from around 1ghz to
1.25Ghz. I don't know if the kit is still sold but maybe you could find
another hf converter and do the same thing.

You can get freq inversion scrambling/descrambling boards (full duplex), but they are $40 - $50 each & you'd need 2 (1 for base and 1 for handset). Then you'd have to hack open your phone and try to install it properly. I don't think it would be worth the effort! There are plenty of scanner owners that have bought 1 of these boards, run the scanner audio through it, and can decode it anyway! I believe there is a board made to plug into the AOR 8000 scanner that decodes freq inv. If you want this type of scrambling, you'd be better off just buying a phone that already has this built in (like Motorola's Secure Clear phones). For real security, buy an Escort SS digital phone.

Just in general, while I would also like to see new and improved systems,
there is a tremendous installed base of equipment that will not go away.
We may not listen to the same things, but over time we'll be able to
listen to about the same quantity.

Regards.

It seems that most have figured out that Two Dogs is just pulling our chain.
He claims to have developed a single board which works with a popular radio
to accomplish something many would want to do.

If he were knowlegable enough to do that, he would KNOW that their would be
a lot of interest, but he would also KNOW that it it's not going to be legal
to sell such a devise to anyone except police and cell service providers.

If he has designed such a board, the only options I can see are:
1) Selling them to authorized buyers ie, law enforcement agencies & cellular
service providers.
2) Posting instructions & schematics for hobbists.

>What do YOU think? Let s hear your opinion.

As someone new to the scanning hobby (but old to others), my opinion may not be valid.

But I have seen other hobbies go through the same sort of upheavals. Perhaps what is happening to scanning is those in the general public who bought scanners got bored and have moved on to other things, but the core group of enthusiasts remains.

I think the internet may go through the same thing someday. A lot of people signed up for an internet account because they thought it was 'neat'. They will soon get tired of paying the monthly tab and quit. (I've heard the average length of an AOL subscription is 4 months.)

I think the new technologies that face the scanning hobby will only enhance it. Or maybe it will go off in a slightly different direction.

Here's a question for you: If you could 'scan' people's email, would you? Is it different than listening to cell calls?

440. Upper-range pro-26 frequency expansionism

Newsgroup: rec.radio.scanner
Date: 1996-06-07 00:00:00 UTC
From: Harold Melton <hmelton@ix.netcom.com>
Message-ID: <31B8B827.4549@ix.netcom.com>
Source record: 232230

Greetings,

I have an R/S Pro-26 hh scanner, and would like to know if it is possible to modify it to go to 1500 MHz, as I
want to use it with my satellite system to receive SCPC audio services. Most SCPC services seem to be on the
lower transponders, which means the upper end of the 950-1450 MHz I.F. block. The sensitivity need not be great
as the blockconvertor will feed it directly .

I also have a Sony ICF-2010 sw recveiver and wonder if it's possible to modify it to receive wideband FM on the
shortwave frqs, for catching the FM-squared audio out of baseband video in the range of .33 - 5 MHz. Yes, I
know an ICOM-100/7000/9000 would be the cat's meow ("meowww!"), but, goodness, I have equipment but not money
running out the ears..

Any info, or pointers to people with substantial relevant brainpower, will be much appreciated.

Please email hmelton@ix.netcom.com -- unless you wanna tell me I'm asking for the moon on a platter.

Thanks, --hm

>
>If anyone has freq info for Eden Praire, MN as well I would appreciate
>it.
>
>Thanks in advance!
>
>Ed

Ed,

Minneapolis Police has five channels.

Channel 1 460.025
Channel 2 460.100
Channel 3 460.175
Channel 4 460.250 Car to Car

Channel 5 seldom used
Channel 6 used by MDT's

Channel 7 460.425 Info channel, DL, warrant checks, ect.

Minneapolis has not yet gone to 800, but there is talk about
it eventually. The above freq's are good, I know, I talk on
them.

Channel 1 during the day covers both Southside precincts.
Channel 2 during the day covers both Northside precincts.
Mid afternoon, we switch to a three channel dispatch. The
third channel is then used by the SW precinct and the NE
precinct, leaving both channel 1 and 2 with the two busier
precincts on there alone. This stays active until usually 3 am
then it converts back to a two channel dispatch.

Minneapolis Fire is on 154.010, 154.130, 154.235, 154.295,
154.340.

I can't give you much more info on them. I use one
channel which is the main dispatch, but I can't help you out
at this time. The battery in my scanner went dead and I can't

call it up. I'm sure it's one of the above though.

Eden Prairie I believe is dispatched along with most of the Western suburbs. The freq they use is 154.610

Hope this helps.....

WinRadio from Rosseta Labs in Australia is now available.

Coverage is from 500KHz - 1300MHz with modes of AM, NFM & WFM. Increment steps can be chosen between 1Khz - 1000KHz. The supplied software does the job although individual applications can also be written. There is no provision in the suppied software for Audio files to be saved although I suppose you could play the audio into a Sound Card and using a suitable utility and save audio that way.

The RF performance on individual frequencies is quite good and would seem quite comparable to some other scanners. Considering the "radio" is sat inside a PC case RFI is very low. I was quite impressed with the SSB performance on Shannon Volmet. I was expecting quite a bit of "noise" but keeying in 5.505 and setting SSB brought in a good clear signal. Sensitivity on our local airfield Volmet was not as good as that of the Bearcat 9000 also sat next to my PC - signal was there though, just about.

I don't seem to be able to get the setup just right for the "scanning" side of things though. The "signal threshold" which can be set to some degree controls the sensitivity of the set - the lower this figure the more sensitive the radio. The Squelsh setting can also be varied (in the same way you would adjust squelch by a rotary dial) however I can't seem to find a good balance of the two....a little more playtime maybe...

Source record: 232237

In this newsgroup or in rec.radio.swap I just saw someone
selling the AOR8000 with some mods added for just under what
it is new (he wants the $ now). This radio will do it all,
but as a posting here says, they think better made is Yupi
7100. There's now a 7200 & less capable 8000 also.
The Yupi's are going for $400 right from grove (just saw it
10mins ago). I owned both. Never used Yupi for more than
glorified CB receiver on long road trips because the AOR8000
can do so many things. You can tweak just about any aspect
on it. But you can't go dropping the AOR- it's just not made
as solid as the Yupi's case is. AOR will let you connect
up to your PC (i'm connecting it to my Palmtop that also
fits in my pocket) with ScanCat or Probe software. The AOR8000
costs something like $550, but several are sold here in these
newsgroups today, one saw was just posted.

> If anyone has freq info for Eden Praire, MN as well I would appreciate
> it.

Eden Prarie is running a E.F. Johnson trunked System on 800 Mhz. This was one of the first Johnson trunked public safety systems and was featured in a multi-page spread in Radio Resource (a radio industry publication).

Thier freqs. are:

856.4875
857.4875
858.4875
859.4875
868.4875
868.7625 (probably conventional used as talk-a-round)

It is very doubtful that you will be able to lock on to any conversations, and since this is probably a digital system is is very doubtful that you will recieve audio. Good luck.

Hello out there!, I've noticed there is not much reference to New
Zealand scanning topics, are there any Kiwi scanners out there?
I live in the Wellington region of New Zealand and scanning has been my
hobby for a couple of months, currently using a UNIDEN UBC2500xlt hand
held scanner which is connected to a rather large Japanese discone
antenna on the roof (25-1300mhz)
Would anybody have a frequency list for my area?, I know that most of
the enjoyment from scanning comes from finding the frequencys yourself,
but I would like to add to my somewhat small collection.
You can contact me via this echo, or my net address which is follows;
v6quad@welcom.co.nz
I do enjoy reading this echo, the overseas stuff is most interesting!

I have used their repair service twice - once for a dropped hand held radio,
and the other time for a problem with a shortwave.

In both cases the radios came back in 10 days.

The service was fine - it's easier than shipping the stuff somewhere. Just
drop it off at the store.

>>or just follow the next call. Before I release it I need to know
>>what the legalities are, and what it would be worth.

I do not know anything about the legalities of such an item but here is my $.02 on this product. First off I must say that I, as an experimenter would be quite interested in such a product espically if you probided programming libraries to code your own proggies.

A complete turnkey cellular tracking system was selling for several thousand at the last surveillance expo. Here is some info on the company that was selling them:

S.S.A. International
213 S. Tyndall Parkway
Panama City FL 32404
(904) 785-9681 Voice
(904) 747 1376 Fax

There is someone else that sells something like this from Canada that you have to provide/modify a PRO2006. He is getting about $400 for his product. His name is Bill Fischer and unfortunately I do not have his info at this moment.

There are two ways that you could market this.:

1) Sell them to experimenters as a kit for around $250 - $400. You probbably will sell quite a few of them but may risk some legal trouble. This is a grey area since you are selling electronic parts only.

2) Sell a complete turnkey system (including the scanner) exclusively to law enforcement and cellular service centers for $2000 - $2500. (What the hell the government pays $300 more than an avberage consumer for an unblocked scanner just because the consumer has to purchace additional parts and do the unblocking himself) There probbably is no risk here but you will then have to accept purchace orders and other hassles in dealing with law enforcement.

just my $.02

It's not a problem unless you are in a metro area and the wonderful
McDonald's start popping up at ever major intersection with their low
power units operating on the same business frequency as you are and with
the Same PL tone as yours. The FCC should have put all those low power
eating establishments specific frequencies by themselves instead of just
sticking them all over the business band.

MFJ-247 SWR Analyzer for sale or trade. Has built-in RF generator and built in 10 digit LCD display frequency counter. The RF generator covers 1.8 to 30 Mhz. The 10-digit frequency counter goes to 179 Mhz. It has an swr meter and input for external frequency source to extend the range. The analyzer is in good working condition. $99.00 Plus shipping or trade for scanner or other interesting electronic items.

Going to the air show next weekend?

Off the top of my head:

tower: 119.6/340.2
gnd: 121.8/340.8
security: 139.5/138.8/165.1375
runway access (refuelers, etc.): 140.1

(These are from memory, so take them with a grain of salt.)

Not having military UHF on my scanners, I can't be too much of a help
with that beyond what I wrote here.

Check the latest "Scanner Master" for Greater Philadelphia/South Jersey.
You can pick it up at "Ham Buerger", although at their prices, I wouldn't
buy anything else there unless you can't get it anywhere else ;-)

You may want to keep 121.5/243.0 in mind, too. My squadron mates were doing
an equipment check about a week back, and when they fired up our "Little-L-per"
DF rig, sure enough an ELT was going off...right on base. The culprit was
eventually tracked down inside a P-3 on the flight line.

Cheers,

No, they subtract 400Mhz from the frequency. The reason they people in the show had it tuned 49Mhz was because when they were producing the show, the audio wasn't really coming from the scanner, they were mixing it in with their production equipment. Also, most scanners you buy cannot be set to the cellular band anyway without modification. Why would the people producing the show waste time to fix up the scanner when they weren't even needing it to tune in the cellphone. If you knew how much other work is needed to produce the show, you'll realize there isn't enough time to deal with minor details like this. If they had everything perfect in every TV show, they'd never get produced.

I still don't believe you can do this without monitoring ALL the control channels at the same time, and you physically can't do this with just one scanner not matter how you mod it, or whether a PC is attached. It can still listen to only ONE channel at a time.

Yes, you build it box which could tune in a random call, and follow it when it changes cells (till it gets out of range), but I think it's impossible to reliably pick up a particular singled-out user and get them EVERY time they make a call. Legal issues aside, I'm talking about the technical.

http://oak.oakland.edu:8080/pub/hamradio/mods/standard/c508a-1.mod
is where I got the mods from. This was supposed to recover the
cellphone band as well, I removed both of the jumpers, but the cellphone
band remained locked out- guess its because it was a US model.
Ive found the receiver is very insensitive above 465MHz & suffers
from a lot of image interference, but for its size is an excellent
radio.

Handheld Scanner Pro-46, made by Realistic, 100 channel memory,

- supports 29-175 MHZ, 406-512 MHZ, 806-956 MHZ
- weather scan, backlight, priority /lockout channels
- Has three mods:
--- cell band restoration
--- speed up - 34 ch / sec --- scans 2.5 times faster than original
--- discriminator output - used for pocsag decoders or
fax/weather imaging
(those cost me $35 each)
- Includes the usual flex antena, belt clip, cellular antena and
the original manual
- Includes a POCSAG pager/fax/weather computer interface, compatible
with PD-201 POCSAG decoder, and JV-FAX fax/weather/slow scan
tv programs - plugs into the discriminator output and pc's
9pin serial port, decodes at 100% error free using the
discriminator output
($100 at L0pht's)
- $270 CDN, $200US
- perfect working condition, upgraded to a Pro-2026

I've done the same and connected with a standard mono lead between the ear socket of the AOR 8K and the mic jack of the Sanyo. Work's great!

I understand the volume dial of the Sanyo determines the level at which the voice activation kicks in during recording. I've set mine to 5 and the AOR 8K to about 1/3 volume. No probs.

I had thought of this for myself but now I've joined this newsgroup I see that there are a few others as bright as me! You see it was nigh on impossible for me to get a cassette connector for the AOR 8K here in NZ - well when I wanted it anyway.

I would still like to connect the AOR 8K to my PC, not to control the scanning, but to program the memory banks easier. I am finding it difficult to find something here in NZ for less than $465!, and nothing that I can see before I buy.

Yep, Discovery Channel stays confused. For the past three years they've been re-running a 5-year-old documentary that is full of errors, at least two of which appear to be outright, intentional distortions. For the past three years, those issues have been raised a number of times with the appropriate people at Discovery Channel. But they take no responsibility for it. Their answer is that they bought it from someone else. It's unfortunate that we really don't know what to believe when we watch the Discovery Channel now...consequently it's not very often.

I'm a 22 yr. old guy livin in Jasper Alberta who's looking for info on how to go about getting my amateur radio license. If anyone has any information to pass on please e-mail me at cjburch@ycs.ab.ca as I do not read these newsgroups very frequently.

Thanks again.
Chris

The company that manfactures the device has been in business for
several years. They have recently had to move to a larger building,
and have expanded their facilities.

You new unit WILL be warranted for ONE YEAR.

I've been looking at these two scanners, and it seems that my choice
will be between the two. Can someone point out the [dis]advantages
to either over the other? Which one is a better choice?

Hi all

There's a new Radio Comms web site in Australia that deals with all types of radio communication in Australia. The web site is currently under construction and is very limited, but it will have some good links.

It's worth a look.

The URL is:- http://iccu6.ipswich.gil.com.au/~dgraham
or try:- http://www.gil.com.au/~dgraham

Chicago Area Radio Monitoring Association

"The Premier Organization for the Radio Monitoring Hobbyist"

The next official meeting of CARMA will be held...

When: Saturday, June 29, 1996
12:00pm Lunch (purchase is required)
1:00pm Meeting

Where: Phillies Pizza Bar & Grill
6300 S. Kingery Hwy.
Willowbrook, IL
(708) 654-0101

Phillies is located at Rte 83 and 63rd St, west of Rte. 83.

Everyone is welcome to attend and beginners are especially encouraged. Questions and discussions include Fire/Medical Services, ESDA, Law Enforcement, Federal agencies, Aircraft, Shortwave and the latest in monitoring equipment and accessories.

Everyone is welcome to bring information they would like to contribute in the form of handouts. At least 75 copies should be made to ensure everyone gets a copy.

If you have any scanning or computer equipment you would like to sell, please bring them along.

CARMA has a newsletter available via subscription. Anyone with any questions about CARMA or would like a sample newsletter may send a SASE to:
CARMA
PO Box 2681
Glenview, IL
60025

CARMA also has a BBS that is available via subscription where information and questions are shared between meetings. Dial in at 708-852-1292. 8-N-1 and up to 28.8k access. BBS subscription info available on-line. Features include QWK mail, message areas and a library of files. For an additional charge, new FCC licensee frequency grants are available from Scanner Master on the BBS...Great for keeping that frequency database up to date!

Anyone with questions about CARMA can also contact the following...

Jerry Smith via Internet E-mail at 73747.2143@compuserve.com.
or Will Sperling via the CARMA BBS.

What about having it work for the Pro 2042, could it be adapted to work with this scanner? Then I would be interested!!! Price for a scanner hobbiest, I think anyway, should be around 75 to 100 bucks. Following cell phones isn't really that much fun if it starts getting to expensive, unless your a P.I. then it's worth it. Good luck

502. Cordless phones

Newsgroup: rec.radio.scanner
Date: 1996-06-08 00:00:00 UTC
From: jamoran@indirect.com
Message-ID: <4pc84o$80a@globe.indirect.com>
Source record: 232173
Cross-posted to: rec.radio.scanner,alt.radio.scanner,alt.dcom.telecom

I had someone ask me about using a cordless phone on a business telephone system, they wanted someone in the warehouse to be able to answer the phone as they moved about. I explained about the different kinds of cordless phones available. Then, I went on to caution the caller that anyone with a scanner tunes to the cordless frequency can hear the conversation unless it is scrambled....

Never ceases to amaze me why people think just because it's a PHONE, their conversations are private. I went on to explain, that anything with an antenna that transmits radio frequencies can be intercepted by someone who has a device (Scanner) that can tune to the transmit frequency!

FWIW, "Next Step" is produced by KRON (NBC affiliate) in San Francisco.
Try their web pages: <http://www.nextstep.com> or <http://www.kron.com>.
New episodes have been produced (hosted by this season by the "Answer
Guys" - Paul and Phil), unfortunately, both Discovery Channel and KRON
(and their local cable service "BayTV") continue to air plenty of old
episodes (hosted by Richard Hart)to fill out their schedules.

Not usually. The converters drop the 800 mhz band to receive on 400
mhz, in general. This is true for both the GRE converters and the
Ramsey unit.

Yes. You are correct. We have tried it and it seems to be a very
good program.

The benefit of using our product is the fact that you do not have
to tie up a computer. The Always-In-Touch is a stand-alone unit
and comes with an AC adaptor and phone cord.

Thank you for bringing this matter to the attention of the group.

Has anyone successfully hacked the Motorola MDT terminals. I have heard and believe it is true that while not normaly encrypted per-se they use a unique non-ascii data format. I have seen the MDTS at a few Hamfests but haven't in a while. It would seem that a simple decoder with the right (backward engineered) software would do the trick. If no one has done this I may be willing to give it a try. Let me know I won't bother if it has already been done. Thanks Jim

I confirmed these freqs:

468.375 Command (Media, Cycles)
464.625 Refreshment and Music trailers etc. They lead the
procession
468.4625 Some kind of talk-around - the support/gear trucks?

Also, heard activity on the following, but were unable to determine if
was 'torch-related'.
469.500,469.3625

Check also any interagency freqs; 155.370 "Statewide" is active in NW
Ohio.

I confirmed these freqs:

468.375 Command (Media, Cycles)
464.625 Refreshment and Music trailers etc. They lead the
procession
468.4625 Some kind of talk-around - the support/gear trucks?

Also, heard activity on the following, but were unable to determine if
was 'torch-related'.
469.500,469.3625

Check also any interagency freqs; 155.370 "Statewide" is active in NW
Ohio.

I have an FCC masterfile CD-ROM, I think it's the best frequency source for finding frequencies FAST...If I am going on a trip, I can quickly look up frequencies form all across the USA on the CD. However, the CD I have does not tell me what the frequenciy channel designation is, only who the license holder is. For FRequency use, I either listen to the frequency or try a source such as MONITOR AMERICA...it's layour is easier to follow than that of the Police call books, Plus, it coers most major metropolitan areas and tourist attractions!

520. OS456 serial port question

Newsgroup: rec.radio.scanner
Date: 1996-06-08 00:00:00 UTC
From: mayes@cts.com
Message-ID: <4pckot$f8p@news3.cts.com>
Source record: 232191

I have an OS456 with a Realistic 2006 scanner. I would like to use my serial mouse, modem, and OS456 all at the same time. (Greedy aren't I?) I am running under Windows 95. As you might guess I am fresh out of serial interrupts after the mouse and modem. My serial ports are on the motherboard and seem to be fixed at IRQ3&4. My modem is capable of IRQ2/3/4/5/7, but I've only had luck with IRQ3 or 4. Two questions:

1. Can I persuade Windows 95 to let me use IRQ7 for the modem? This should be ok as IRQ7 is the printer and it should be sharable as long as I don't print while using the modem. I have looked at the Control Panel and it doesn't seem to have standard setups for com ports other than IRQ3/4.

2. Is there a non-standard serial card available anywhere which doesn't use IRQ3/4? It would have to be recognizable by my ScanStar for Windows SE software and Windows 95.

Thanks.

There are a few scanners, notably from Yupiteru, that cover shortwave as
well as VHF/UHF, but they're extremely expensive, and the particular Yupi
I'm thinking of is illegal in the U.S. due to covering the cellular phone
band. (Scanners don't eavesdrop, people do, but try telling that to the
people in the government and the phone industry.)

In general, however, you'd do better with a dedicated scanner and a dedicated
shortwave receiver. The frequencies are radically different, so you shouldn't
expect equal performance from one unit.

Sometimes, if you ask nicely, you can get a list of the 10-codes and signals
at the police station. The problem with asking for them here is that they vary
from place to place (although some are nearly universal). Like David said,
try Police Call, or see if there are any Scanner or Police/Fire/EMT BBS's in
your area that might have them.

Cheers,

JQ.

Sealevel Systems (864-843-4343) makes a card called the DUOCOM (Part #3088) that allows IRQ settings of 2-5, 7, 10-12 and 15. I've got a HF receiver and a 2006 with the Opto board sharing COM1 via a switch box, a TNC on COM2, a modem on COM3 and COM4 is free. Having a PS/2 mouse is a definite advantage.

Bill:

Good to hear from you. A public comment...

I always welcome questions and comments from you and other monitoring enthusiasts, with ONE EXCEPTION.

For general clarification: I work for the Los Angeles Fire Department (LAFD), often also referred to as the Los Angeles -City- Fire Department. We are the 110 year-old Department that protects the City of Los Angeles.

The Fox TV series "LA Firefighters" is an attempt to dramatically portray members of the Los Angeles -COUNTY- Fire Department, the LAFD and LACoFD are separate agencies.

Neither myself -nor- my agency (LA CITY FIRE) are soliciting comments regarding this show.

If you have comments regarding the show, you may e-mail:

<askfox@foxinc.com>

If you have the absolute NEED to contact our friends at the LACoFD, you may write them c/o their published Headquarters postal address:

Los Angeles County Fire Department
1320 North Eastern Avenue
Los Angeles, CA 90063

Other than that TV series, fire away!

If your question could be considered of widespread public interest, please post in this newsgroup. Otherwise you may e-mail me at the address below.

<brian.humphrey@prodigy.com>

Brian Humphrey
Public Information Officer
Los Angeles City Fire Department

I would venture a guess that the AM/FM card works because of the
higher transmission power, but I would also guess that putting a
scanner card in an RF rich PC would not perform too well.

Try putting your scanner next to your PC and note any
effects you may see.. :)

Philip:

If you're not worried about Cellular coverage, I'd go with the PRO-26.
I've not heard too many good comments about the AR-2700. Possible even
a better consideration would be the AOR-8000, or the BC3000-XLT.

:>scanning. Any help would be appreciated, thanks.

There is a mod but it's not for frequency range. To access 1025 Gig you would simply punch it in as such. You don't use a third decimal for the gig.

Ie if I wanted to listen in on 1.2 gigs it would look on the scanner as: 1200.000.0

Give that a try and see if it works.

538. Olympic Torch Run - Michigan

I ordered a Pro-26 (no gaps) about 5 months ago via snail mail. It took longer to arrive than I had expected (one month), but Javiation was right there with me all the time. Evidently, there was some kind of "mail" problem. They were all set to ship me another one when the Pro-26 arrived in the mail.

I would buy from them again as they are a class outfit!

Message-ID: <4pf3n0$8a@newsbf02.news.aol.com>
Source record: 232059

Hello.

I have a PRO-51 Handheld Scanner for sale. It is a brand new unit in the box.
Here are the specs/information on it:

- 200 channels
- 800 Mhz
- "Band-Search" for VHF-air, Marine, Fire, and Weather
- HyperScan with 50 channels/sec or 100 channels/sec
- Priority Mode
- Lockout Channels
- Backlight
- Keypad lock button
- Memory Backup
- Earphone jack, external power jack, charging jack, and BNC antenna jack.
- Rubber ducky antenna included.
- Takes 4 AA batteries.
- Can run off AC current or DC with appropriate adapters.
- Covers the following:

29-54, 108-174, 406-512, 806-823.9375, 851-868.9375, 896.1125-956 Mhz..

From the catalog: 6 1/6" tall, 2 7/16" wide, 1 11/16" thick

Retails for $319, I will take any REASONABLE offer.
At this time, I don't have a receipt, but that could change (I have to search
for it, which is why I'm selling on the 'Net..)

Terms: You pay shipping and/or COD charges, depending upon the offer.
I would be willing to open up the scanner before shipping to make sure
it's fully functional.

Please leave email with offers/information.
Thanks!

In the Miami area and other metro areas Fhp uses 900 mhz trunked! But
there signal digitly coded! Some area they use VHF 154.000 to 156.000!
The Turnpike UHF Patrol uses 453.000 to 454.000.

Yeah that's right. The FCC should have put those fast food places on a special band. I get tired of scanning the business band and hearing a McDonalds clerk say: 'that will be $2.99 at the first window sir...' I live in Redding, Ca where the mall is close to about 4 of these places and I scan the Security guys at the malls (esp. JCPenney and Sears) and McD's is on the same the freq's (along with Carl's Jr., Wendy's, and Dairy Queen). The FCC needs to just re-think a few things and maybe it will all be alright (sure).

The new "Always-In-Touch" paging device entered the market about
six months ago. It is advertised nationally by Hello-Direct of
California for $119.00.

We do not manufacture this product as we are resellers. We
have tested the device extensively and found it to be very
reliable and useful for persons who have Caller ID service
as well as a pager.

We are sorry you were offended by our recnt posting on Usenet.
We attempted to place this information on groups (such as
those dealing with electronics)that we felt the users would be
interested.

Therefore, your comment about "operating on a shoestring" has
no validity, since we are resellers.

Thank you.

INFINITY PAGING

He was simply trying groups that may have a large number of people interested in his device! It is an ad, and you could call it junk mail, but at least he is being smart about where he is posting it! The fact that he followed up with more info means he is more serious about marketing his product than the average spammer! I'd rather see a post like this than "MAKE MONEY SCREWING OTHERS ON THE INTERNET USING A PYRAMID SCHEME" or "GAY AND LESBO PHONE SEX" that appear all to often in these newgroups.

Cut the guy some slack. Skim over "junk mail" that you're not interested in.

yes - or have your sound card and your printer port share the same
interrupt (irq7) and then try using irq5 for the modem......

>2. Is there a non-standard serial card available anywhere which doesn't
>use IRQ3/4? It would have to be recognizable by my ScanStar for
>Windows SE software and Windows 95.

a couple of companies make a 16550 serial card that has high interrupt
capabilities.....you can choose any interrupt that is available for
either com port - and set them as com 1/3 and com 2/4.

Or as the other fellow said - you could try a bus mouse.

Several Fast Food Chains have switched to the new "3M" headset (marked
as "GM" on the headset) in past 6 months. These headsets are allocated
to the 902-928 Mhz band (920.xxxx speaker) (903.xxxx headset).

They've also reversed the frequencies on most of the UHF Panasonic
headsets. Those allocated in the 464/469 range have switched the
speaker frequency (repeater) to 469.xxxx and the headset frequency

(input) to 464.xxxx. Also, the newer Panasonic systems transmit only if car is present at the drive-up speaker.

Bob

: I don't print while using the modem. I have looked at the Control Panel
: and it doesn't seem to have standard setups for com ports other than
: IRQ3/4.

What is wrong with using IRQ5? On many systems, it's open. If you have a soundcard there, you can probably move it to IRQ10. I'd choose it before IRQ7.

Try Control Panel, System, System Properties, Device Manager, this will get you to a menu where you can diddle with the device settings. I myself can't try it now because I want to stay logged on, but it looks this will let you set IRQ's of your choice.

If this fails, try visiting the "local library" (bookstore or book section of computer store, that is). Try first with the Win95 Resource Kit, a big fat book written by Microsoft. If you can't find it in there, there will be tons of other books to try. Buying the book(s) optional.

: 2. Is there a non-standard serial card available anywhere which doesn't
: use IRQ3/4? It would have to be recognizable by my ScanStar for :
: Windows SE software and Windows 95.

Likely so. Any good computer dealer should be able to answer that. If they aren't smart enough to, try another dealer.

Also, as a last resort you could get a PS/2 type mouse and card, plug that card in, and it uses irq12 and won't take up a com port.

I think it has something to do with the FM signals....
when the scanner is on it's on.....and the mic picks up
these hisses or birdies or interference from other antennae
in area, especially ham-users. When the scanner scans there
are electrical contacts made which the mic picks up on. ..
i gave up on it...

some one said there may be a filter to insert between A and B

check your scanner stores or facilities like Radio Shack...but
be sure you speak with store manager...at RS....plenty of bad
info from clerks...they just sell to make their commissions and
will agree to anything you suggest.

> those frequencies and owned them.
> I always knew that Ronald was taking over more and more of our
> society.
>
The situation in Canada (and probably the USA) is you don't own the
frequencies, you are only allowed to use them. If the FCC licenced
both McD and the moving company to use the same frqs (which is VERY
common on business band) then not much they can do except either
change frequencies or make certain that they have different PL tones
for the radios. The PL function will squelch out all but your own
users. Normally McD (or other fast food outlets) will use low power
units so other traffic would not be a factor.

I'd think this method would be pretty safe. To be even safer, sell it
WITHOUT a few of the necessary parts (but parts that are easily
obtained through other sources). That way, you aren't selling
a complete *anything*, just a circuit board and some parts, etc.
What the experimenter does with those parts and some they
get from other sources is not your problem.

RS used to sell a voice-activated recorder that allowed you to switch between high and low sensitivity. The "low" setting seemed to ignore the speaker hiss and birdies...I used to set up to recorder and scanner in my dorm room to catch cordless phone traffic when I was in college (during my younger, perverse days :))

Regarding your PS, you might try a Y-splitter. You can probably find something like this at (you guessed it) Radio Shack.

Best of luck,

Jay Q.

577. Pro-51 7A4 and 3A3 no test mode 1

From: bchild@iadfw.net
Message-ID: <31ba46d1.352100@news.airmail.net>
Source record: 232122

Hello, I swapped my brand new pro-51 for one with a 7A4 date code but can't get anything to happen with the lockout,2,9 combo. All the other ones work as expected. I also tried this on a 3A3 date code in another store with similar lack of results. Has anyone seen these? Is the keyboard combo bypass for that sequence but maybe the rest of circuit is intact. Trying the same sequence on the new one before the swap yielded the stored frequencies with one alteration to move one frequency out of cellular band.
Anyone?

How about using a "bus" mouse - i.e. a PS2 mouse that comes with its own card, uses its own interrupt, and
leaves you with two workable com ports. I have been using that system for several years, and have both com
ports usable.

The Olympic Torch Relay came thru Central and Northwestern Ohio on Saturday June 8th, 1996. Here is some information that I was able to confirm.

The relay is utilizing 8 channel radios. The main frequency that I was able to confirm was 468.375. Other possible frequencies are: 464.600 & 464.500. The other frequency that was utilized was 464.625 and this was for the "coke" truck/vendors. They were using names like: Maverick, Dixie, Pork Chop, Death Star, Rock & Roll, July, and Road Kill.

This should give everyone a good start and hopefully this listing can be expanded and further information added.

Other information about the entourage is as follows. The typical configuration starts with the Local Police, Torchbearer Security (State Patrol Officers), Media Truck (31 foot motor home with an open deck for camera people), Torchbearer (surrounded by security officers on motorcycles), Command Car (central point of communications), Shuttle Car (transport staff and guests), Caravan Services (31 foot motor home which server as a work station and security), Emergency Medical Services, Bicycle Wagon (carries bikes), Torchbearer Pickup, State Patrol, Traffic Control, then finally Local Police.

Good luck and happy listening.

On the subject of Studio Transmitter Links:

Generally the true link from the studio to the transmitter is microwave but the 450.010 - 450.990 MHz frequencies are pretty interesting. They are called remote links it's where the traffic helicopters and other remote reporters can be heard.
You can also hear all conversation in the studio. I'd like to know WHY; the DJs transmitt continously on these frequencies. Who needs to hear this? Why don't they close the mic?

There is a scanner card available in Australia that (from memory)
scans from HF through to the mobile phone frequencies. All you need
is to plug in an antenna, load the software and scan away.

Daniel - I have scanners, CBs, SWRs, etc. for the past 35 years and I have tried many different types of antennas for all. My personal experience with scanner antennas has been that for everyday scanning in my particular area and terrain (SF East Bay) a simple and cheap Radio Shack ground plane (RS # 20-014 / $30) works the best with all my scanners (RS 2006 / BC 250 / Regency MX-7000). I can get low band CHP cars up in the Sierras and as far south as San Jose and get good UHF reception over the hill from SFPD. 800 Mhz freqs come in okay, too. I'm sure there are better antennas but with a 20' mast this cheap-o pulls in signals more than adequately. Good luck and let me know what you end up with..... MikeyA......

Hi, the quick answers to your questions are;

Yes there are scanners that do what you ask.

The prices on them start at around $600 (for AOR8000 Handheld) and go up
to $1500 and up, for desktop models.

What you are asking for is very difficult to accomplish, especially to
include the shortwave .1-30mhz band.

Yes it is much better to have two radios, a SW receiver and a VHF/UHF scanner.

In my opinion $300 is the STARTING price point for any decent scanner.

Good luck, Greg

> don't think there is actually any formal definition.

Actually, the terms are defined by international treaty, currently the
"Radio Regulations" (Geneva, 1982). In english, MW is 'medium-wave'. The
proper designations for the bands are:

```
Freq. 30kHz 300kHz 3MHZ 30MHz 300MHz 3GHz 30GHz
VLF | LF | MF | HF | VHF | UHF | SHF | EHF
| | | | | | |
Band <--4----|---5----|---6----|---7----|----8----|----9---|---10---|---11-->
| | | | | | |
Wave- | lw | mw | sw | | | |
length 10km 1000m 100m 10m 1m 10cm 1cm
```

After using up the adjectives very/ultra/super/extremely, they gave up and
band 12 (300-3000 GHz) has no name. The bands below 9 kHz (the lowest freq.
subject to treaty) are usually refered to as ELF.

There are a few used by RT, unfortunately they are shared or "trunked" with Sacramento County's new "Unscannable" Yeah right !! 800 mhz communications system. So in order to hear light rail, you also MUST listen to the Sheriffs Dept., Sac. County Fire etc.. Your best bet in attempting to scan that is go to Radio Shack and spend $9.99 on Police Call Plus, it's accurate but the hard part is to follow the 40-50 different 800 mhz frequencies Sacramento Co. is using!!
Good Luck.

any radio can have scanning features. I have a SONY-2010, it can scan 115-136mhz (AM) Aircraft band as well as 120-30000khz the MW (Am broadcast) and shortwave bands as well as 76-108mhz WFM (FM & TV broadcast)

I also have two AOR scanners that can scan 0.5-1300mhz and a Regency Desk model that also can scan 25-550 and 800-1300mhz

Scanners, typically are designed for local listening while Shortwave receivers/Scanners are designed for International listening (ie BBC, VOA, Radio Netherlands..Radio Japan..etc)

Hi, I bought a Bearcat 250 at a garage sale, fixed a couple a bad solder joints and now it works fine.

I need some help with the features or a manual.

How do I work the range search?

Can a trick it to go below 146 or other slightly out of band freqs?

Thanks George

>
> Paul
>

Paul;

The easiest simplest gin pole is a pipe. You will need to have some kind of hook or clamp at the bottom to attach to the tower, but you could get away with using U-bolts if the tower legs are not too large. At the top you simply need a pulley or block for your load line to go over. And of course, the pipe has to be long enough to reach above the tower top adequately to lift and plant the tower section/antenna. Be carfull about lifting too much weight with such a gin pole, since the actual capacity is not know unless you have the pole design checked. A good 2" OD heavy wall aluminum pipe should work fine for the average 10' tall TV tower section or VHF/UHF antennas.

If you are tracking a single call then you only need to monitor the
control channel for the 'channel' that call is on.... the problem with
what he is suggesting is that it is impossible to monitor two things
(the control channel and the audio channel) with one reveiver and only
one vfo.....

The exception I place before the group is this... are the phone
channels under contoll of data in the contol channel or imbedded in
the audio channel?

another interesting side question... When a cell phone is on and not
in a [lace or receive call mode... Is the audio section of the phone
powered or unpowered?

snip

weather the mod is reversed or not will depend on what failed and how
they repair it...

They dont care if/how you modified the unit unless they can prove it
violated the warrantee and you are asking for a warantee (free) repair

But if the method of repair is to replace the board which failed, and
its one you modified then yess you will get the unit back with the mod
'apparently' undone..

>can do this? Let me know.
The reason is that the upper channels of the TV (remeber tv's used to
go to 83 now only to like 65) were taken away from TV (no-one used
them) and given to cellular... celular uses 30kHz spacing TV is 6Mhz
wide per channel so when the particular channel that is in the audio
section of the tv channel goes into use the the audio will be heard on
your tv untill the channel is changed.
Its not a wierd occurance its just a physical fact!

why, I
:>don't know, it's for a friend of mine whos not into computing, just
:>scanning. Any help would be appreciated, thanks.

There is a mod but it's not for frequency range. To access 1025 Gig you
would
simply punch it in as such. You don't use a third decimal for the gig.

Ie if I wanted to listen in on 1.2 gigs it would look on the scanner
as:
1200.000.0

Give that a try and see if it works. <<

Hi Aaron, i think you may have missed the point.

The R7000 covers 25-2000 mhz, by adding 1000mhz to the 25-1000mhz
section. Therefore, you can not get say, 1022mhz, because it does not
cover 22mhz to start with.

In the UK some companies made an add on board to cover 50khz to 25mhz
ie, short wave bands. This, with the 1 ghz add button, gave coverage
from 50khz-2000mhz.

The R7100 has coverage from 25-2000mhz, without having to 'add' 1000mhz.

Hope this makes it a little clearer.

I believe the data is embedded in the audio channel...cellphones don't
receive 2 frequencies simultaneously either.

I have for sale an AR8000, cell modified, with a EDCO interface cable. I am thinking of selling it consignment, but would like to try this route first so that I am not burning 25 percent commission off the top. I am in the Washington DC area. I have original box, all accessories (I think), manual, sales documentation, etc.

I am seeking $ 525 for everything.

NOTE: E-mail me back at DBallenger@aol.com NOT at return address shown above.

The better vox recorders have a vox sens on the volume control.
try setting it so it does not trip when there is no audio.

>P.S. Is there a mod for being able to use the earphone jack and still
>hear through the speaker?

you can home brew one but if you chance your volume setting it will
effect the level to the recorder. The best setup is a scanner that has
a recorder output. Both the R7000 and the pro 2006 have them and they
work great with a vox recorder.

G'day,
yeah we have uhf c.b here in Australia. Ch 1 - 8 can operate either simplex or duplex (use repeaters). ch. 9 - 40 are simplex. 5 watt of transmission power. the frequency range is between 476mhz and 477mhz. its a lot better than 27mhz. since i'm living in a flat area uhf is a lot better.

>... Propino tibi salutem!

I don't care if my mother produced the show. It had wrong
information, they know it, they carry a broadcasting licence and have
a duty to pass correct informtion to the public. They are an
educational channel not the Toronto Star.

From reading other mail I see that they were told of the error in the
past and continue to show and give false information.

If you can not tell it as it is, then don't tell it at all.

Too many people (stupid people) think if its in the news or in the
paper then that's what happend or how it is. WRONG.

Lets not forget, THIS IS AN EDUCATIONAL CHANNEL or at least it should
be.

If it were an instructor in a school with far less a group of students
he would be fired or forced to go back to school himself.

Ohhh I'm getting started now....

>Anyone?

Hi,

A prior post in this newsgroup told me about the following proceedure.
First start a display test by pressing the 2,9,band or the 2,9,moni keys
(I forget which I used, the post mentioned both) before the display test
is done press the 2,9,L/OUT keys and hold them down untill the test is
done. This loaded the 25 freqs into memory (and deleted all the others
by the way).

My pro-51 has a date code of 7A4 and this worked for me. It's also for
sale. See other post in this group.

Hope this helps.

> -- David

Hi David, once you have the computer interface, there is software available both commercial and shareware/freeware to do the mod. Or if you want to do the changes by hand, there are complete instructions on various websites that discuss in detail what lines to change.

You would be much better off making the investment in the computer interface and whatever software then to blow $50 bucks for someone else to pay for their computer interface. It takes all of about 2 minutes to download and upload. You can even get updated bandplans and just upload them.

Check out some of the AR8000 websites or the mail list, If you don't have any on hand, send me a private mail at troy@cogentdata.com and I'll send you a recent listing.

-Troy

Marcum N. Nance III (designer@clark.net) wrote:

: If you are tracking a single call then you only need to monitor the
: control channel for the 'channel' that call is on.... the problem with
: what he is suggesting is that it is impossible to monitor two things
: (the control channel and the audio channel) with one reveiver and only
: one vfo.....

Calls are initiated on a control channel. Once the call begins, it never goes back to the control channel. The handoff to the next cell is done solely on the voice channel. Yes, if you have a scanner tuned it can follow a single call. The scanner can pick up the handoff from the voice channel then retune itself like the cellphone does.

The thing is that there are 21 forward and 21 reverse control channels for each of the two phone companies. If your are looking to listen to *me*, you have no idea which cell my call will begin in. When I start to make a call, my phone will initiate the call on the reverse control channel of the cell nearest me. In order to lessen the chance of a snarf box picking up by code, the ESN goes out only once. If my ESN is good, the cell tower replies back on the forward control channel telling my phone which frequency to change to. If your scanner is scanning all 21 control channels, there is only a 1 in 21 chance you are going to get me.

The bottom line is that with one radio, you can find someone to listen to and track them, but you cannot reliably find *me* and track *me*.
A device which can pick *my* calls up would have to have (at least) 21 RF units in it, this is why such unit would cost upwards of $10,000.

: The exception I place before the group is this... are the phone
: channels under contoll of data in the contol channel or imbedded in
: the audio channel?

When the call begins, they go over the forward control channel. After the call has begun, handoffs are commanded to the phone thru the forward voice channel.

: another interesting side question... When a cell phone is on and not
: in a [lace or receive call mode... Is the audio section of the phone
: powered or unpowered?

The audio section is probably not powered, because designers of the phones want to minimize power consumption. Very important to market the product.

643. Re: Standard's "CT508-A" And Cellular

Apparently, the mods don't work in later versions of the C-508.
The one I bough (new in December) worked as advertised with the
mods.

Some of the insensitivoty reported may stem from the antenna.
I find some images in the 400-410 range that are from 450-460.
However, the cell band works fine and it seems as sensitive
as any of the other radios I have that cover that range.

PS. The C-508 I bought WAS a US version.

Hello there,

I was wondering if anyone had Solano county freqs, and maybe freqs for cities in solano county too. I am particularly interested in finding Solano county fire/ems freqs, with descriptions of what they are, and perhaps the fire station numbers and locations. If anyone can help me out, I would greatly appreciate it.

email: shep79@napanet.net

Thanks!

[snip]
>A friend of mine bought one for his wife, who likes to listen to talk
>radio but lives in an area where she can't hear too many stations, at
>K-Mart for $49.95, $10.00 less than EEB had it for at the time.

Many Brendle's locations are closing, and where they are closing they
are putting their stock on-sale. Therefore, I got my SupeRadio III
at 20% off of their $49.95 ($39.96) list here in Raleigh, NC a week or
so ago. The discounts will get even better over the next few weeks,
IF they continue to have the radios in stock.

HOWEVER, their scanner prices are STILL *not* so great. Their price
for the SPORTCAT is $199.95, so even at 20-25% off you can still get
about the same deal elsewhere.

As always, _caveat emptor_.

>Never ceases to amaze me why people think just because it's a PHONE,
>their conversations are private.

Most people know in their "heads", not their hearts. It can never happen to me syndrome!
In the town where I live, there are so many people into scanning, it is not a question of if, just a question of how many are listening to a particular conversation!

Did you suggest the 900 mhz DIGITAL cordless as a way of improving security? Many of the 900mhz available are not digital but a few are, and will provide a certain level of privacy. The Uniden 9100 Spread Spectrum Digital is an example, though their latest unit (can't recall its model) is NOT a true digital.

ukfan1a@aol.com (Ukfan1a) wrote:
... with a Panasonic portable TV .... I can get cellular phone reception.

Cellular in the US was carved out of the frequencies originally assigned to UHF TV (chs 70-83 covered 806-890 MHz). An older TV with a manual tuner can receive cell on chs 80-83 with some fiddling with the fine tuning (the mobiles show up on chs 72-77). Since there are 200 cell channels for each TV channel, and analog TV tends to drift without an AFC lock, reception is poor at best.

Further to my article "WINRADIO" was the product and is made here in
Australia. It sells for about $800 aussie dollars and the specs
are...Synthesised PLL receiver with triple conversion
Covers 500kHz to 1300MZ
Receives all modes including wide FM and SSB
Sensitivity typically 0.5uV (nom 1uV)
Windows software but can also run from DOS
Will run on an old 286-based-AT
Program memory channels in 100-channel blocks
Single key control over virtually all radio functions
Screen shows memory data including call sign, description and mode
User can wright own control software to perform specified tasks.

The place to get WINRADIO in Australia is
EMTRONICS 94 Wentworth Ave Sydney 2000
Their phone number is 02-211 0988 or FAX 02-281 1508

660. FAF

Newsgroup: rec.radio.scanner
Date: 1996-06-11 00:00:00 UTC
From: mulligan@ACM.ORG
Message-ID: <4pj918$lhl@HOPPER.ACM.ORG>
Source record: 231947

The FAF - Frequently Asked Frequencies file was updated on 01 June
and is available as:

ftp://oak.oakland.edu /pub/hamradio/docs/misc/ scanner.faf
-and-
CompuServe Hamnet Lib 2 FAF.TXT

New sections are: Aeronautical Frequencies; Public Safety Intersystem; and
FRS - Family Radio Service. There are minor editorial changes to five other
sections. For those unfamiliar with the FAF, it contains -

Details of the most often requested bands. Includes channels, frequencies
and usage notes for: cellular, cordless, mobile & aero phones; TV;
CB, FRS & GMRS; railroads; marine; aero; public safety intersystem;
ambulances; weather; film & wireless mikes; 'dot' freqs.

As the name implies, it was originally created to deal with the more common
requests on rec.radio.scanner, but that doesn't seem to be working <g>.
Please, if you want to know the US cordless phone (or the other) frequencies,
download the FAF first.
/* barry /&

661. Table of Frequency Allocations

Newsgroup: rec.radio.scanner
Date: 1996-06-11 00:00:00 UTC
From: mulligan@ACM.ORG
Message-ID: <4pjcdk$llc@HOPPER.ACM.ORG>
Source record: 231948

The FCC Frequency Allocations summary file was updated on 01 June and is
available as:

ftp://oak.oakland.edu /pub/hamradio/docs/misc/ fcc.allocations
-and-
CompuServe Hamnet Lib 2 FCCTBL.TXT

While there are no major changes, this release includes extension to 1400 MHz
as well as some breakouts of the aero band and US Govt & military allocations.
For those unfamiliar with the file, it is -

A summary of the FCC Table of Frequency Allocations for the 30 - 1400 MHz
range. Since it boils 90 pages of data down to 190 lines, a little detail
has been lost <g>, but it will guide a scanner user to what's where.

While this file is not intended to tell you the local FBI frequencies, it
does give a general layout of usage in the US and will guide you to the best
places to look for a taxi dispatcher or the county fire department.

>

Sorry, but I should have mentioned that the unit can only detect and track
a call to or from a phone in your area. The main problem with tracking cell-
phones is the after two or three handoffs, the call dissapears because it is
too far away. This is a limit imposed by your scanner and the height of
your antenna. My unit can only follow a phone if it is on a close control
channel.
Yes you can only monitor one control channel at a time, but a particular
(or the next) call can be followed from cell to cell, channel to channel until
it is to far away.
What DID you expect? At least it is better than hearing bits and peices of calls.
I was offering a solution to a common problem, it's not ment to be the "Ultimate'
survalance equiptment for the FBI, just a hackers/scanners companion, and if you
know ANY phone in your area, or are following someone, then they WILL be on the
same control channel as you!

>>Yes, you build it box which could tune in a random call, and follow it
>>when it changes cells (till it gets out of range), but I think it's
>>impossible to reliably pick up a particular singled-out user and get them
>>EVERY time they make a call. Legal issues aside, I'm talking about the
>>technical.

Not true, if the person with the phone is in your 'AREA' you can get his call
EVERY time, from the moment he places or recieves the call until he hangs up!

>If you are tracking a single call then you only need to monitor the
>control channel for the 'channel' that call is on.... the problem with
>what he is suggesting is that it is impossible to monitor two things
>(the control channel and the audio channel) with one reveiver and only
>one vfo.....

See below......

>The exception I place before the group is this... are the phone
>channels under contoll of data in the contol channel or imbedded in
>the audio channel?

Any commands given to the phone during a call are given as digital
information to the phone during, and on the same channel as the audio.

(This is the 'Bbbzzzt' you hear just as you loose the call, or if you
didn't loose the call then it was a power-change command.)

>another interesting side question... When a cell phone is on and not
>in a [lace or receive call mode... Is the audio section of the phone
>powered or unpowered?

Usually unpowered, this saves batteries, extending standby time.
The reciever feeds the processor with the tower data, looking for
it's number in the data stream.

OK, To start again, I was asking a question about the legality of releasing
this product, I don't need any heat from FED's etc etc.
I am surprised (and flattered) that it is so unbelieavable, but the crys
for the device made me start development in the first place, so now it is
done I wanted to know the LEGALITIES of selling it.

If anyone knows, please respond. (If you simply don't believe the product
exists, keep it to yourself or start another thread, I just asked a
simple question about helping out some scanner-philes with their hobby.)

(PS- it would be cheap and easy to install.)

TD.

I had one of those when they were new. They're easy. It's a great radio, even though it doesn't go that high. All you gotta do is enter in the frequency directly, and hit "E" for "Enter". That's it. Get a "Police Call" or "Monitor America". That's all you need. You could also use the search function.

That's why I'm pretty happy with my digital cordless. Noone can listen in on
that one. Too bad you guys in the States don't have that option. Same goes for
digital cellular. Only slowly coming around with PCS 1900 MHz networks in a few
urban areas I've heard.

Well, the "kit" suggestion has been mentioned before. I'd have to agree with that. Especially if you sold it without some components that are readily available at Radio Shack. I have seen several kits for sale in the US that allow you to build a device that would be illegal to operate (active radar jammers, cable descramblers, etc.). Many companies selling kits point out that YOU (the customer) are the manufacturer of the device, not them.

>And what is a "selectable gate time" on the cub?
>
>Thanks!

I've owned both the scout, and the predecessor to the cub, For true frequency measurement the cub will excell in accuracy, and probably in speed. However you will be frustrated with annoyance of having to hold it in your hand and constantly watch the screen. The gate time is simply the amount of time that it takes to make a reading, the faster the gate time is set, the faster the measurements will come, but the less accurate they will be. if you're using this for a bench counter, the solower gate makes sense since you can keep the RF going for a couple seconds, however if you're in the field, you need to get the number and use it.

Hope this helps! '73 de Mike

Mike,

Try the IRC channel #wun. It stands for Worldwide Utility News
(Shortwave Utilities) but VHF/UHF topics are also discussed in this
channel. There was a post a little while ago about a channel called
#scan, but I never saw any activity there.

That's basically what I wanted to use it for. I bought the Radio Shack
Pro-25. It was on sale for $200. But it does NOT have the military air band.

Another thing I like about it, is that it will run for a long time on 4 plain
ol' AA batteries.

There are plenty of digital cordless phone products available in the U.S.
For a business applications, if you just need one cordless phone, I
would recommend a spread spectrum phone.

The best SS phone I have used is the Escort Courier 9600 from Cincinnati
Microwave. This phone uses their "SureLink" direct sequence system.
CNMW has licensed "SureLink" to some other cordless phone makers. Look
for the "SureLink" logo on the Cobra "CP912" and Southwestern Bell
"Freedom Phone 900" and "960".

If multiple cordless phones are needed, there is a wireless phone system
from "Spectra Link" (not to be confused with CNMW's product name). They
offer a system that will give you sort of a private cellular system in
your facility. It uses 900 MHz frequency hopping spread spectrum.
Depending on the size of your facility, more than one base unit may be
needed. They can support anywhere from one "base unit" and one phone
(kinda pricey for that though) up to 160 or so "base units" for 700
phones! Pricing for the simple stuff starts at about $3000 from what I
remember. This is a 902-928 system and requires no licensing.

Curtis

P.S. I do not work for, or am I affiliated in anyway with CNMW or
Spectra Link. I am a satisfied Escort Courier user. And I have seen a
demo of the Spectra Link system which is pretty impressive if you have a
need for that technology. Views here do necessarily reflect those of my

employer. Some assembly required. Batteries not included. Your mileage may vary.

>
>Thanks
>Bob VE3UK
Are you sure that you want the 10.7MHZ IF? I have modified my Pro2004
to get to the 10.7MHz and 455KHz IFs(10.7=WFM and 455=NFM & AM). I
use my Kenwood R2000 to listen to various SSB signals.
Most data units use audio straight from the demodulator. Before the
de-emphasis(spelling?). If you really need the IF out, just email
me and I will dig up the data. I never throw anything away. The Pro2004
and Pro2006 have nearly the same electronics. I can not offer any advice
on the AR3000A.

>Partol that lists Which Frequencies are used in what counties etc??

>--
>@b

I don't know about 800MHz, but there are only 4 VHF freqs + UHF vehicle extender. F4 is car-car. Of the other 3 VHF, which run repeaters, which one is in primary use depends on the patrol station, rather than county /per se/.

It's easiest to simply monitor all 3 VHF repeaters. For detailed info, I recommend Scanner Master Florida Communications Guide, or you can reverse-engineer Police Call Volume 6 under Florida, State Of.

Troop K operates on the Florida Turnpike and has its own set of frequencies, which are all UHF except for the vehicle extenders (opposite of the other troops).

Pro-2006 455 IF is available at pin 3 of the NFM detector. It is the IC
that has 10420 marked on it.

AR3000A 455 IF is available at pin 3 of the IC marked 3357.

I hope this helps.

691. Re: Who has Bay Area mil freqs?

Newsgroup: rec.radio.scanner
Date: 1996-06-11 00:00:00 UTC
From: hankbop@aol.com
Message-ID: <4pkuse$snb@newsbf02.news.aol.com>
Source record: 231978

shep79-

I've been monitoring Mil Air freqs in the SF Bay Area for about a month
but have picked up action on these freqs:
235.1 Navy/Air Force refueling
364.2 ACC USAF
321.0 STRATCOM
311.0 STRATCOM
322.8 USAF refuel
260.8 "Bigfoot" Operations McChord AFB, WA
234.6 USAF
349.4 USAF AMW

There are others but I can't confirm them as of yet. I've intercepted
refueling off the coast as well as training exercises. One interesting
intercept was a TR-1/U2 out of Beale AFB with altimeter gauge problems. If
you hear any "Pinion" callsigns, more than likely they're U2s out of
Beale.

Oakland Center ATC covers a big area but here's some freqs close by. You
can hear a combination of commercial and military traffic.
125.85
127.8
323.0
353.5
134.15
387.1
127.95
132.95
269.1
316.1

Since it seems you're in Napa you might be able to pick up Travis AFB. I
can't here in Oakland. Here's the freqs:
Tower: 236.6, 255.9/120.750
Approach/Departure: 371.2/119.9, 291.0/126.6, 395.8/126.6
Clearance Del: 335.8/127.55
349th MAW CP: 319.4
AR-5H primary: 283.9
AR-5L primary: 289.7
AR-5H/L secondary: 319.5
Command Post:349.4/130.650
Dispatch: 376.0
Ground Control: 289.4/121.8
AMC CP: 349.0/141.9

Keep in mind that scanning mil freqs is hit or miss. There are days where I'll only get a couple of hits and other days when there'll be lots of action. About 90 percent of my scanning is mil air. One of those cheap Radio Shack VOX recorders comes in handy. You can leave the scanner unattended for hours, come back and listen to the hits. Hope this'll give you a good start. Good luck.

: then I would say it should not belong here.

Not! What if EVERYONE who wanted to pay only $15 for an internet account tried to advertise by spamming their message to thousands of groups. This and all other groups would be so cluttered we couldn't talk scanners or anything. In case you didn't realize, these people spammed thousands of groups, just a few at a time. I saw the post in a whole lot of unrelated groups. If it's not right for people to do this advertising, what gives these fly-by-night special privilege to do this. The product had NOTHING to do with scanners. It is correct for those of us in the Usenet to *severely* censure this type of activity, if it is not checked our 'net will be made useless.

699. WTB: ERICSSON/GE 800 MHZ TRUNKED EDACS HTS' (PRE_OWNED)

I am currently looking for 2 Pre-Owned Ericcson/GE 800 MHz Trunked Portables. The units must been in great shape, and at least one must have full DTMF keypad. Must run on EDACS, as well as other Ericsson trunking formats. If you have a couple units, along with rapid desk chargers that you would like to sell at a reasonable price, please feel free to contact me via e-mail.

Also I've been told that they make a flip-phone type radio too. Would appreciate any information on that as well, and would consider a pre-owned unit.

Thanks.

I work for a Tv repair store and I have seen instance's where if tv audio
is set in SAP mode in the menu and the tv is close to a cell tower I've
also heard of them picking up police calls in this mode too.

Seems the only way to keep up on rigs that can be modified to get the "forbidden band" is to buy early, before
anyone figures out the mod, and complains to the manufacturer.
The early Standard C-508A's had 30 khz step size as standard (no pun intended)in the 800 mhz segment. The
image reception was excellent, even without hardware mod.

If you check Javiation home page, Standard has come out with a mini scanner with about the same frequency range
as the AR8000 (DC to light!). I believe it is just a bit longer than the C-508A.
At Dayton (for those interested), one of the Standard representatives was from Japan, and showed us a tri-band
version of the C508A!! WOW!. 2Meters, 440 and 1.2 Gig! The bad news is that it will not be marketed in the US
anytime soon because of the prohibitive cost. Buying a unit from Japan won't work either, as their government
prohibits rigs that can be opened to full range transmit, and the Japanese Amateur band plan is much different
than the US. Oh well!

To anyone who owns one or both of these. What's the difference (other
than the Scout's:
1. Interfacing w/ scanners
2. 400 freq memory
3. "Paging you" facility

Also, the Scout advertises 13-msecond seek time. Where does the cub
rate?
And what is a "selectable gate time" on the cub?

Thanks!

There was a lot of discussion on DTMF decoding last year. Some guy was
pushing his DOS crippleware program that was supposed to be able to
decode but I tried it and found it to be unreliable in it's results.
Subsequently, I downloaded COOL150.zip. This is a windows program that
can do a lot of stuff with sound files including a fourier transform to
identify the fundamental and harmonics in a complex waveform. It
required a little work to decode the digits but I found it to have good
accuracy. I'm sure it is still available at
ftp://ftp.cdrom.com/.13/asme/WIN_ENG/

Regards,
Bob...

Don't bother - the information is freely available all over
the net. The version I have:

==========
==========
Radio Shack PRO-51 Test Modes

(c) Howard Bornstein June 2, 1994.
(Revised 10/10/94)
(Revised 11/4/94)
(Revised 4/11/95)

[This document may be freely distributed for all non- commercial
purposes as lo ng as it is distributed unchanged and complete.]

There is an interesting test mode in the PRO-51 that, combined
with the direct search feature of the scanner, lets you pick up
out-of-band frequencies. You will have full access to the 66-88
Mhz ranges as well as the cellular base range of 869-896 Mh z.

Actually, there are several test modes in the PRO-51 (most of
these comments sh ould be true for any Uniden-made Radio Shack
scanner, such as the PRO-46). I'll describ e them first and then
how to take advantage of one of them to get the restricted frequ
encies.

There are three data test modes. These modes completely destroy
any frequencies you had programmed into your scanner, so it's
best to use these techniques before you p rogram your scanner. If
you have already programmed it, you'll have to decide if these
new capabilities are worth reprogramming.

TEST MODE 0. Clear the scanner.

A well-known method of clearing the scanner to all zeros is to
hold down the 2 key, the 9 key, and turn on the scanner. All
frequencies will be lost.

TEST MODE 1. Fill channels 1-25 with test frequencies.

Press the 2 key, the 9 key, the L/Out key, and turn on the scanner.

This fills channels 1-25 with these frequencies:

1 30.050
2 40.840
3 49.900
4 138.150
5 162.400
6 173.225
7 406.875
8 453.250
9 511.9125
10 108.500
11 118.800
12 127.175
13 135.500
14 66.450*
15 76.825*
16 87.425*
17 157.800
18 482.3625
19 29.000
20 54.000
21 806.000
22 857.200
23 888.96*
24 911.500
25 954.9125

* indicates not within the PRO-51's normal coverage. More on how
to use these i n a minute.

TEST MODE 2. Fill channels 1-17 with test frequencies.

Press 2, 9, Manual

Fills channels 1-17 with these frequencies:

30.00, 40.00, 50.00, 140.00, 155.00, 170.00, 410.00, 460.00,
510.00, 54.00, 109.00, 118.00, 127.00, 135.00, 810.00, 860.00,
950.00.

There is also a display diagnostic mode.

TEST MODE 3. Display Test.

Press 2, 9, BAND or 2, 9, MONI.

This put the display in test mode. Every annunciator and every
digit element is turned on in a scan from the left side of the
display to the right. To keep this test mode continuous, release
the buttons before the first scan finishes. This mode does not

affect stored memory. Press any key to exit this display mode.

How to use the test mode frequencies

Now, if you've decided to try test mode 1, you will find several out-of-band frequencies stored in your memory channels. Channels 14-16 hold frequencies in the blocked- out 66-88 Mhz range, and channel 23 holds a frequency in the blocked-out cellular base range. Once you have these frequencies stored in a memory channel, the PRO-51's direct sear ch feature will let you search though these ranges. In the cellular band, the scanner searches in the correct 30 Khz steps.

You don't have to keep these frequencies in the channels they were stored by th e test mode. You can move them to any channel in the scanner. Here's how.

First move the frequency to a monitor channel:

While on a channel with one of these frequencies, open squelch completely. Pres s direct search button, either up or down. The direct search button puts the scanner into search mode and the open squelch holds the frequency. Then press the Monitor button. The frequency is now in the monitor channel indicated in the display.

Now you can move it to any regular memory channel in the scanner:

Enter the channel number Press PROG Press MONI Press the number of the monitor channel if the proper channel is not displayed Press E(nter)

The frequency is now permanently stored in the memory channel. You can do a dir ect search from this memory channel at any time.

The 66-88 Mhz range mainly covers TV audio. However, there is a strange phenome non concerning TV audio and the PRO-51. Channels 4, 5, and 6 fall within the 66-88 Mhz range (71.75 Mhz, 81.75 Mhz, and 87.75 Mhz respectively), yet the PRO-51 will not pic k up the audio frequency while searching in this range. However, TV channel 2 audio is a t 59.75 Mhz. When you add the intermediate frequency of 21.6 Mhz, you get an image of t he TV channel 2 audio appearing at 81.35 Mhz. This does come in, although raspy, sinc e the PRO-51 is receiving in narrow FM mode while TV audio requires wide-band FM mode for proper reception.

These test modes also work on the Uniden-made PRO-46 and PRO-23 Radio Shack scanners.

----------Update Notice ----------

Apparently, as a result of this document, and publication of this information e lsewhere, the FCC demanded that Radio Shack pull all existing PRO-51s, PRO-23s, and PRO-46s off their shelves and

were forbidden to continue to sell them. This is particularly puzzling, since all three of these scanners can receive cellular via images without any special modes or procedures.

As of the end of October 1994, PRO-51s have started reappearing in Radio Shack stores (date code of 7A4). These units were apparently shipped to Uniden to have the cellular frequency that appears in test mode 1 (channel 23) removed. If you follow the procedure for test mode 1 on the new PRO-51s, you'll instead get the frequencies from test mode 2, which will not allow you out-of-band reception.

However, Uniden apparently didn't spend much time with this modification because it is still possible to put the 'new' PRO-51s into test mode 1. Here is the procedure :

First initialize test mode 3 (the display test). While the display is being updated, hold down the 2, 9, and L/Out keys. Keep holding them until the display finishes filling up. It will stop with all of the test frequencies for test mode 1 loaded in memory!

PRO-51s with a date code of 8A4 (August 1994) will be able to do all the test frequencies with the exception that channel 23 will not contain a frequency in the cellular range. The other out-of-band frequencies will still be there.

Hi!

Yesterday I bought a scanner. It's an old one, with crystals. The scanner's name is COMMANDER and it's model no 168.

I would like to get in touch with someone who has got the COMMANDER, because I have no manual and it would be nice to learn how all the buttons work.

The scanner covers the frequency range 75-88 Mhz and 380-420 Mhz. Are there any interesting things to listen to there. I live in Sweden, but if there are some international frequencies that are interesting - like a weather satellite, please let me know.

If there is a general way to switch crystals, can someone please describe to me how it is done.

Adam,

I own both radios and there is no comparison. It's the AR8000 by 30 lengths. Nick's posting says it pretty well, but add to that the alphanumeric tags for frequencies and it's all over for the R1.

Good luck.

Harold

The "Always-In-Touch" paging device retails for $119.95 from
Hello-Direct in California. We are able to keep YOUR cost well
below that price by keeping our "overhead" low, by charging $89.95.

Maybe you would want to visit the Hello-Direct Website and see a
photograph of the unit to compare prices: http://www.hello-direct.com

If you think it would be better for us to provide everyone with
an 800 toll-free number, and charge $119.95...we'd be glad to!

Things are working out fine the way they are but we do appreciate
your marketing suggestions.

Thank you.

Infinity Paging of Maryland

Several times in the last few months, someone has made reference to some
big announcement that was to be made by Uniden...we're still waiting.
Anyone know what this was all about?

Thanks, Bill Crocker

I heard a rumor that they were going to announce a scanner capable of
following trunked transmissions. Supposedly something will be due out
this fall.

Try the following... all for Summit Cable Services:
461.650
461.850
462.120
464.975

This may be used by their news crews (if they have one):
161.640

Hope these help!

Hi!

I want to mount a CB in my car, but I really dont want to add another
antenna. Is it appropriate to somehow splice into the radio antenna?
Or should I persue finding a way to mount another antenna. . . .

Along those lines, (I know this is a scanner group, but I thought I
would try) anyone have a preference for a small CB unit?

Any experiences or comments appreciated!

Speaking of MSP, when are they planning to change over to the new 800 MHz digital system? I remember reading last summer in an APCO magazine/journal an article about how Michigan was purchasing a Motorola ASTRO system for statewide comms -- initially for police then eventually for other state departments.

You should shop around for a device which is made specifically for what you want to do. That is, you should buy a box which is designed to allow a CB and a regular radio to share an antenna. They can be found where car radio equip. is sold. Don't try a do-it-yourself job, you can end up ruining one or both of your radios this way.

However, I'd really recommend a second antenna for the CB. Especially if you plan on talking on the CB, and want to be heard more than 50 yards away. If you're planning on mainly listening on the CB, not talking, the shared antenna will probably be acceptable.

WHTQ is indeed in Orlando. The jock, Chris Rhodes, used to work up here in Ocala, where I am about 70 miles NW of Orlando) The other station you mentioned on 96.5 is in Atlanta...I forget the calls, but I hear it down here occcasionally when the tropo-ducting is in.

Last night (6/11) was indeed amazing. EVERYTHING was open...FM broadcast, 10-meters, 6-meters, etc...PLUS a trop opening on 2-meters/440! I couldn't decide what to work and/or listen to!

Sir,

You have voiced your concerns about spamming and we told you
that we placed this into groups where we thought our product
would be acceptable.

You then thought we were not reputable because we "don't have
the capital to market our product" and we explained that
we were resellers.

Now you have accused us of spamming again, and that "it isn't
right."

You are the only one complaining! Everytime you post an objection
we answered you so we could clear the air!

OK. We got your message. We've stopped. But do not try and
say our product is not good. We have tested the device for
several months and it is very reliable. We have discovered
hundreds of people who are interested in receiving Caller ID on
their pagers.

If you can find a better product...go buy it!

Tuesday night, 9pm EST til almost 10 oclock.
I was sitting in my car in downtown Ithaca, NY and couldn't find any interesting music to listen to locally. I tuned to 96.5 to try for the Rochester, NY AOR station which can be heard well off and on. I DID get a rock station, full stereo, with a great signal. Thought it was WCMF, Rochester. Once the advertising came on I learned it was WHTQ in Orlando, FL!

I stayed with the station for almost an hour, then a religious broadcaster (regular occupant of the freq. in this area) from PA took over. Shortly thereafter, around 10 pm i heard another station wipe it out and the advertising was for Six Flags theme park in GA, so possibly a Georgia station, tho not as strong as WHTQ and only lasted about 5 minutes. Pretty excellent conditions; not bad for a car radio!

I called WHTQ and talked with the jock, Chris, and he was amazed, and had just received a call from Massachusetts. Wonder what other folks caught on VHF 73, Joel N1AEP

741. Re: Alexandria Va Freqs

Newsgroup: rec.radio.scanner
Date: 1996-06-12 00:00:00 UTC
From: jiminfalls@msn.com
Message-ID: <4pn1ic$3tc@news9.erols.com>
Source record: 231920

Alexandria uses a 7 channel trunked system. This system is used for police, fire, and all other city services. The frequencies are:

854.4875
855.5625
856.8375 (used for phone interconnect)
857.8375
858.8375
859.8375
860.8375

These two are listed as "conventional talkgroup" frequencies:

854.2125
855.5125

Fire dispatch is simulcasted on 154.4300.

Other frequencies:

453.5500 Police Mutual Aid Radio System (P-MARS)
039.5400 Statewide Interdepartmental Radio System (SIRS)
464.9250 Torpedo Factory

Also, check the marine frequencies (156.3000 to about 157.2000) for activity, as Alexandria is on the waterfront.

If you want details on other area agencies, let me know.

David

In Los Angeles I can pick up bursts on 173.075. The deal is that there seem to be little bursts quite often. When the unit is activated does the unit send a signal at a predetermined inverval (ie. every 1 sec)? It seems that I am hearing a burst avbout every 15-30 sec pretty much all the time. Is this a diagnostic/control/test signal or a lot of cars getting stolen around here?

> appreciated! Thanks!
>
> AdamI don't own either one but the feedback I've seen here about both units I would say there really isn't any comparison. The AR is by far the better rig even if it had only the same features as the R1. Every person I know who has owned an R1 complained about the lack of selectivity, imaging and intermod problems.

I saw a recent posting here from an R1 owner who lived out of the city and felt that since he wasn't swamped with RF his performed OK, but he could not take it any where in high RF fields, which is almost everywhere these days.

If you are considering upgrading to the AR then I would say you have made a wise choice.

I have been considering swapping my Kenwood HF mobile station to an AR8K and Scout, I would really like to own one. I now have a 2006 and an AOR 2515 that has 2016 memories in 78 banks but it is not very portable.

Hope this helps...

There is a coupler on the market today that for fairly cheap ($19.99)
that takes both units and makes them use 1 antenna without cutting,
splicing or any hard labor.

****
If you only want to have one antenna, the best thing is to get a combination AM/FM/CB antenna, and replace your
stock antenna with it. Radio Shack even sells one of these. NEVER splice Coax cable. That could result in a
horrendous impedance mismatch. The performance of the combination antenna, however, will probably be worse
than if you had a dedicated CB antenna.
Hope this helps!

: we were resellers.

Spamming newsgroups is sort of like nailing your advertisement to a telephone pole, you know. You don't own the pole, you don't ask for permission from the telephone company. You are also taking advantage of the fact there's a road nearby. And you sign is creating an eyesore for everyone driving by.

If you saw someone advertising on a telephone pole for say, carpet cleaning, would you invite those people into your home? Or would you prefer to do business with someone who has enough money to buy a quarter-page in the Yellow pages? Even if the price was a little higher. To me, the choice would be obvious. An advertisement on a telephone pole is an announcement that the person putting it up there doesn't really have enough capital to run their business right.

> or at least most of us.

I must agree with Ron. Most scanner owners that I know are gadget freaks and news of a new one is always of interest. Okay, it's not a scanner but it sounds like a nice toy. I just wish something similar were available here in Britain but, so I believe, our Caller ID system is different.

>This is an Ad, BUT it's in good taste.

Exactly. I've never understood some people's hatred of so-called junk mail. When it comes through the door, it takes just a few moments to decide if you want to read it or bin it and, occasionally, there's something of interest. It's even easier with newsgroups, if I'm not interested in what the header says, I don't bother to download the body of the message. I would guess that I read about 5 per cent of what's coming through so another ad here and there really doesn't upset me. I can understand the worry about the flagrant spammers who clog up systems by offering to tell the entire world how to make money fast but this advertisement appears to have been carefully placed in groups where the typical reader may have been interested in this type of product.

I just hope the guys at Infinity Paging don't think the anti-ad rantings are typical of readers of this group. I, for one, would like all manufacturers and retailers who have new products they think I would be interested in to let me know about them.

Hi, Jason:

Your best bet is 156.800. That is the international calling and
distress frequency. Anther good Coast Guard frequency is 157.100.

The American marine band is basically 156.300-157.200 or so. If you
live near a big lake or the ocean, you should be able to hear marine
comms in this frequency range.

First, they don't care what it sounds like because that particular
use of those frequencies (broadcast remote) is "protected" by ECPA - in other
words illegal to monitor in the USA. :-)

Second, this type of operation is often in full-duplex mode to
support IFB (Interruptable Fold Back), where the studio can cue a remote
unit while that unit is sending to the studio.

I saw the Winradio at the Dayton Hamvention, it had a cost of $699. The guy made a comment to me about having an empty slot in my PC. I said I have the empty slot but not the $699 to pay for the card.

760. Helo freqs from Grissom Air Show

Newsgroup: rec.radio.scanner
Date: 1996-06-12 00:00:00 UTC
From: scottr@iquest.net
Message-ID: <Dsv5E7.Bvn@iquest.net>
Source record: 231939

I went to the Grissom Air Reserve Base Air Show 96 this past Sunday June 9, and managed to copy down some freqs from some of the helicopters that were there. I hope someone finds these useful. If anyone else got any freqs from any of the other aircraft that were there, I'd appreciate seeing a copy. I was able to get into the C-5 cockpit, but there weren't any readily available freqs to copy. I was going to try to get freqs from the E-3 AWACS, KC-135, KC-10, etc., but it started raining and everything closed up before I had a chance....oh well, maybe next year.

If anyone is planning on going to the Dayton air show this year, make sure to take your notepad with you. Airshows are a GREAT opportunity to get freqs. Just make sure you ask permission of the pilot or other fine military person standing around the aircraft before you start copying. They usually will give their ok, but you don't want to look like a spy or anything while copying down freqs. If there were anything classified that could be seen, they wouldn't have the aircraft open to the public anyway.

Here's what I've got:

These freqs are from an AH-64 based at Ft. Campbell. They were copied from the weapons systems officer cockpit placard:

33.2000 Military Ft. Campbell AH-64
35.0000 Military Ft. Campbell AH-64
36.9000 Military Ft. Campbell AH-64
75.2500 Military Ft. Campbell AH-64
118.1000 Military Ft. Campbell AH-64
121.8000 Military Ft. Campbell AH-64
122.2000 Military Ft. Campbell AH-64
126.2000 Military Ft. Campbell AH-64
129.0000 Military Ft. Campbell AH-64
129.1000 Military Ft. Campbell AH-64
129.2000 Military Ft. Campbell AH-64
129.3000 Military Ft. Campbell AH-64
139.3000 Military Ft. Campbell AH-64
141.0500 Military Ft. Campbell AH-64
143.3000 Military Ft. Campbell AH-64
143.4000 Military Ft. Campbell AH-64
149.8500 Military Ft. Campbell AH-64
229.0000 Military Ft. Campbell AH-64
229.1000 Military Ft. Campbell AH-64
229.2000 Military Ft. Campbell AH-64
229.3000 Military Ft. Campbell AH-64
241.0000 Military Ft. Campbell AH-64
242.4000 Military Ft. Campbell AH-64

255.6000 Military Ft. Campbell AH-64
267.3000 Military Ft. Campbell AH-64
275.8000 Military Ft. Campbell AH-64
280.9000 Military Ft. Campbell AH-64
302.2000 Military Ft. Campbell AH-64
344.6000 Military Ft. Campbell AH-64
367.3000 Military Ft. Campbell AH-64
372.2000 Military Ft. Campbell AH-64

These freqs were from an Air National Guard UH-1 Huey based at
Shelbyville, Indiana (just southeast of Indianapolis about 15 mi).
I managed to copy some freqs from a Shelbyville UH-1 about 3 years ago.
There were some differences in the following list compared to what I got
3 years ago:

236.6000 Military Shelbyville ANG UH-1
239.0000 Military Shelbyville ANG UH-1
241.0000 Military Shelbyville ANG UH-1
241.1000 Military Shelbyville ANG UH-1
242.4000 Military Shelbyville ANG UH-1
255.4000 Military Shelbyville ANG UH-1
255.8000 Military Shelbyville ANG UH-1
257.8000 Military Shelbyville ANG UH-1
269.4000 Military Shelbyville ANG UH-1
272.7000 Military Shelbyville ANG UH-1
284.6000 Military Shelbyville ANG UH-1
285.4000 Military Shelbyville ANG UH-1
307.1000 Military Shelbyville ANG UH-1
343.8000 Military Shelbyville ANG UH-1
343.9000 Military Shelbyville ANG UH-1
348.6000 Military Shelbyville ANG UH-1
354.0000 Military Shelbyville ANG UH-1
355.5000 Military Shelbyville ANG UH-1
383.3000 Military Shelbyville ANG UH-1

These were taken from a UH-60 Blackhawk also based at Shelbyville, IN:

118.6000 Military Shelbyville ANG UH-60
119.0500 Military Shelbyville ANG UH-60
120.9000 Military Shelbyville ANG UH-60
121.9000 Military Shelbyville ANG UH-60
122.1000 Military Shelbyville ANG UH-60
122.4000 Military Shelbyville ANG UH-60

762. Re: VA state police freqs (I-81)

Newsgroup: rec.radio.scanner
Date: 1996-06-12 00:00:00 UTC
From: jiminfalls@msn.com
Message-ID: <4pn2f3$3tc@news9.erols.com>
Source record: 231941

For Virginia State Police, try:

159.0000
158.9850
159.1650
159.1350

Except in Northern Virginia, the VSP operate in duplex mode, which means you will need the mobile frequencies. These are paired with the above frequencies, respectively:

154.9350
154.9050
155.4450
155.4600

Various CTCSS tones are used with these frequencies.

Statewide frequencies:

154.6650 "Tac"--a simplex car-to-car frequency
154.6950 Surveillance--simplex
458.3500 Vehicular repeaters
039.5400 Statewide Interdepartmental Radio Service (SIRS)

154.6800 (simplex) is used by the Executive Protection Unit (EPU), which protects the governor and other upper-level officials. It is used mostly in the Richmond area.

I have always found it funny that many manufacturers list this as a
"feature". Security code systems to prevent unauthorized
telephone line access are *required* on all cordless phones (including
low band analog phones) under "part 15". Any phone that doesn't have it
won't be type accepted by the FCC.

But again, Steve is correct, and be sure you look. These required
methods are not there to prevent monitoring. They are only there to
prevent someone else from access your phone line with another handset.

I've posted similar comments before, so I'll be brief:

I think you're wasting your money by trying to put all that in one box. The SW radio design parameters are very much at odds with the design parameters of a V/UHF scanning. You'll get more for your money if you purchase two less expensive units to do each job.

My $.02 worth...

It is a surprisingly well built unit (considering where it comes from,
very surprisingly well built). It is *not* a "sniffer". It wants a good
signal level before giving you a reading. But for most uses that's a
plus not a minus. I like it as a very handy utility counter.

Hello,
I purchased a Bearcat Thin Scan at a local auction. To my surprise when I opened up the box, the scanner was still in the original wrapping, never used and shining like a new radio. All the original manual and warranty from Electra are still in there. The manual has a copyright date of 1979. Is this radio a collectors item? Is anyone interested in purchasing it? I have many scanners and really have no use for a crystal scanner. If you are interested, give me a price! I live in the South Jersey / Philadelphia area but will ship if you want. Thanks! Lou louis.iocona@compudata.com

David Moore (dmoore@earthlink.net) wrote:
> Please Respond VIA EMAIL

> What is the best way (amperage and time) to charge a 12 volt 4 amp/hour
> gel cell?

I'm using a similar gel cell with a charging current of capacity*.1
(maximum capacity*.15) at 14.4V to charge (up to 10 hours), then
I switch to 13.8V to keep the charge. I built a charger from a
7815 followed by 2 silicon diodes (one is shorted by a switch
for full charge). Since my gel cell has a capacity of 9.5Ah,
the fold-back current of the 7815 is just below the maximum
charging current of the gel cell (1.5A).

The charger is based on a circuit from the 1985 ARRL handbook.

Hope that helps,
Jens, DB9LL

The Freq Fan Club (1-800-RACEFAN or 1-800-SCANNER) does Nite Scan and earphone jack audio output mods. They also sell 850mAh packs and an external semi-fast charger.

You an already get full strength (not attenuated) cellular signals in the 894.0125-915.6MHz range.

> -Kevin Harrelson
> -kevin@dynacs.com
> -kevin@mil.ufl.eduYou are probably better off with another antenna. The complexity of connecting the scanner to the CB antenna and preventing front end destruction is more trouble than it's worth.

Radio shack makes a y adapter for the am/fm antenna that will let you plug a scanner in to the car radio antenna but the antenna is not tuned for any of the scanner bands so it may not be very effective.

You could get some antenna tape (or security system tape, you know for windows and such, rs has it also) and cut a piece for 16" and hook it to you scanner as a high band vhf antenna. You can stick it to glass and make it fairly inconspicious (SP?).

Grove has a deal to use the car body for an antenna but have not heard a review on it. You could also use a glass mount antenna, which is fairly small but I've heard the performance is lacking. It's hard to beat an all band scanner antenna with mag mount that you can hide when you leave the car.

Good Luck

GM a while back had an option of getting a CB installed (factory
installed) and it would
use the existing car antenna. The biggest problem of using this
antenna is the matching.
The antenna is the key to getting out not the radio. My $40
Uniden gets out barefoot
well since the match is pretty flat 1.3:1 across the entire
band. If the antenna is tuned
well, then it will get out. Another example is at my apartment
I have no way to put
up an antenna and there are antenna restrictions. Well the
downspout and rain gutter
match and loaded allows me to make long distance celar contact
on the Ham bands.
An antenna tuner makes that match 1:1 and I think that puppy can
tune a bicycle frame as
an antenna. The bottom line is that there is not loading coil
and the car whip is very short.
Most CB antenna are small whips with a loading coil to make them
look like a 1/4 wave.
The longer 108" whips one sees is the 1/4 wave. It is this
reason why the cell phone
look-a-likes do not work well on the CB band. However, the
through the glass cell
phone look-a-likes works in the Ham 2 meter and 440 bands. The
frequency is high making
the wave length real small (2 meter full wave and 70 centimeter
full wave for both bands)
making those short little guys good. I would not use is for any
HF (10, 11(CB), 15,40, 80...)
you get the picture.

BIll

Subject: Expo 96 Infobot Update

@0A@GROVE ENTERPRISES PRESS RELEASE

FOR IMMEDIATE RELEASE

E-mail address: @0F@expo96@grove.net

Dates for Grove Comm Expo 96 and Keynote Speaker Announced

"Share the experience, bring a friend" is the theme for the 7th annual Grove Communications Expo that will be held on October 18-20, 1996 in Atlanta, Georgia.

In commenting on this year's theme Bob Grove, President of Grove Enterprises said, "Just as we host the Expo as a gesture of good will to the radio obby community, you can be an ambassador for recreational monitoring by bringing a friend to the Expo. With growing pressure from commercial interests to own the radio spectrum and lock out listeners, our numbers are what speaks loudly to the law makers. I'm looking forward to seeing you all this year, and to seeing fresh faces as well."

Formerly known as the Monitoring Times convention, the name of this popular annual event was changed in 1995 to the Grove Communications Expo. The name change was made to broaden the scope of the annual event to cover new and emerging communications technologies.

To help foster the Expo theme, Grove is offering special rates to convention registrants who bring along someone who has not attended a previous convention. If you bring a full registrant to the Expo you can take $10.00 off your regular registration fee of $55.00 for the weekend full of activities. In order to get the special rate, both registrants must register at the same time. Grove is also offering special rates for clubs and their members.

The highlight of this year's Expo is the Saturday night banquet. NASA astronaut and astronomer, Ron Parise, WA4SIR will deliver the keynote speech. Dr. Parise has made two trips into space aboard the space shuttle and during those missions operated the shuttle amateur radio experiments (SAREX). Tickets for the Saturday night banquet are $25.95 and seating is limited, so make your banquet and convention reservations early.

Several special events will be conducted in conjunction with this year's Expo. The Society of Amateur Radio Astronomers (SARA) will be conducting their fall conference for their members during the Expo

weekend. Members of SARA can attend their conference for a $25.00 fee. SARA will also be conducting radio astronomy workshops, forums and exhibiting at the Expo throughout the weekend. Full registrants to the Grove Expo are welcome to attend any of these forums and workshops as part of their registration fee.

On Friday night, October 18, the Expo will sponsor an International Shortwave Broadcasters forum that will be hosted by noted broadcast host Ian McFarland. We expect broadcasters from stations around the world to be in attendance. Some of these broadcasters will also have exhibits at the Expo.

Tours are always a popular event at the Grove Communications Expo and this year is no exception. "We are offering more tour sites this year and increasing the number of people that can go on each of them," said Judy Grove, Expo 96 coordinator. "We took all the information from last year's convention surveys and arranged tours to those facilities attendees most requested." Unfortunately, the most-requested excursion 'The Weather Channel' does not conduct public tours.

Transportation to most of the tours will be in comfortable, chartered buses that will pick you up and drop you off at the front door of the convention hotel (the Atlanta Airport Hilton). The cost is $10.00 per person, per tour, and you must be a full registrant (or spouse of a full registrant) in order to sign up for a tour.

Those of you who are taking the Metro Atlanta Rapid Transit Authority (MARTA) communication facility tour will travel via the MARTA system instead of chartered bus. As part of this tour package, you will receive a three day unlimited pass to ride on the MARTA light rail transportation system anywhere they provide service in the city of Atlanta. Any family member can also use this MARTA pass at any time throughout the three days of the Expo. Three day unlimited MARTA passes will also be sold at the Expo registration booth for $8.00.

This year's seminar program has been expanded greatly. Over 40 seminars covering topics on computers, the Internet, radio astronomy, satellites and space, and scanning and shortwave radio by some of the world's leading experts in their fields will be conducted. Speakers that will be giving speciality forums during the Expo include: Richard

Arland, Keith Baker, Richard Barnett, Kevin Carey, John Catalano, Jacques d'Avignon, Don Dickerson, Steve Dye, Bob Evans, John Fulford, Doug Graham, Bill Grove, Bob Grove, Dr. TS Kelso, Ian McFarland, John Magliacane, Carole Perry, Ken Reitz, Jorge Rodriquez, Doug Smith, Keith Stein, Tom Taylor, Larry Van Horn, Dr. Jeff Wallach, Bob Wyman, and George Zeller.

Spotlight on Scanning

Of a total of more than 40 seminars, eight will focus on topics of interest to the scanner enthusiast. Bob Grove, publisher of Monitoring Times, will kick things off Saturday morning with a forum on Scanner Equipment and Accessories for the Beginner at 9:00 a.m. At 10:15 a.m., MT 's Scanner Report columnist Richard Barnett will give a talk on Monitoring Public Safety Agencies. After lunch, Bob Grove will return to the speaker's podium for a forum on Exploring the VHF/UHF Scanner Spectrum. This will give the scanning hobbyist a good overview of who's who and where they can be found on a scanner. At 2:15 p.m., my forum on Monitoring Big Brother Government Radio Listening will introduce several new federal communications systems and some discrete frequencies in the 225-400 MHz UHF military aircraft bands. The final scanner talk on Saturday will be by MT Federal File columnist John Fulford. John will cover Advanced Surveillance Techniques a look inside the world of bugs and surveillance devices that the scanner enthusiast can hear. Doug Graham will kick off the Sunday morning sessions with a forum on Monitoring 800 MHz Trunking Systems. At 10:15 a.m., Bob Wyman will discuss what techniques and publications can get you started when first listening at a new location; his talk is called Scanning the Unknown. Finally, MT's feature writer on legal listening issues Jorge Rodriguez will conduct a forum on Monitoring and the Law. Live demonstrations of equipment and listening techniques by convention speakers and exhibitors at the Grove Listening Post will also be a part of the program. Future Grove Expo press releases will have complete details on these seminars and the speakers. "We are going to have the biggest and best Expo ever this year," said Judy Grove. "We had a low turnout last year, due to some mistakes on our part, but that will change this year." The Expo will be held at the Atlanta Airport Hilton and the hotel is offering a special convention rate of $76.00 plus tax per day, single or double occupancy. To make your hotel reservation for the three day event call the Hilton hotel chain toll free number 1-800-Hiltons. International callers can phone in their reservations by calling 01-404-767-9000 or send a fax to 01-404-768-0185. You must mention the Grove Communications Expo to receive the special convention rate. Complete details on the Expo 96 are available at the Grove Internet home page on the Internet. Point your web browser to URL address: http://www.grove.net/hmpgexpo.html for the latest information and Expo updates. You can also register for the Expo by sending e-mail to: expo96@grove.net and you can get additional information on the convention by sending e-mail to the Expo 96 infobot at the following address: expo96-info@grove.net. To register by phone, call the Grove order line at 1-800-438-8155 or outside the U.S. dial 01-704-837-9200.

To fax your registration dial 01-704-837-2216. In the words of one

>>
>>The U.S. Secret Service and San Jose local police said Watson
>>operated the cloning scam from his home. CTIA estimated the loss
>>from Watson's operations between $1.5 million and $2.5 million.

Let me get this right..Mr Watson opened up pagers and changed their capcode so as to all be the same, and the loss was $2.5 million?!? At $10.00 per month, he would have had to change 250,000 pagers! Assuming all of them would have otherwise opened accounts, that is. And if you had a "cloned" pager, then you would get messages for everyone elses pagers, wouldn't you? You'd have to come up with a code to differentiate your pages from everyone elses.

Man, with all the trouble it'd take to find a Mr. Watson, get my pager cloned, have it go off everytime anyone else on my capcode was paged, and explain to people the complicated "code" they need to use to page me, it rather just pay $10.00 per month.

This whole thing sounds like the most insane scam I've ever heard of! Or am I missing something here?

Steve

I think (it doesn't mean much) I have followed this an it is my impression that even though some people think that the product offered is not appropriate for mass market this is the Internet.

The company involved did it's marketing with consideration. It did not flood the net they did it slowly and stood behind their postings. To myself they are at the least backing their ideas.

To all who think they are not doing justice, wait until the day when your provider sells your e-mail address in mass and when you check your mail its worse than sorting out the mail in November.

This is my say on this I hope this will at the least have you put down the beer and tell the cat to leave you alone to relax and enjoy.

>
The RS unit is simply a no frills frequency counter. For $100 it is OK. Mine works fine. It displays a frequency for the duration of the transmission. If you miss it, it is gone. The Scout is a top of the line "Oh-my-gawd" piece of equipment. It logs frequencies into memory, and keeps track of how many hits on each frequency. It can program certain radios (AR8000) and do other neat tricks. It costs more than $300 (I think.) Check out Opto's home page for better details.

Which one you want depends on your checkbook and what you want to do with it.

One of the worst "radio" mistakes I've seen was in a mid-1970s
movie of little note called, "The Sky Riders".

Terrorists had kidnapped a rich man's wife and kid and were communicating
their demands via a radio (on HF supposedly, with a Yaesu FT-101x, if
I remember correctlly). This took place in Italy.
Anyway, as the terrorist was talking to the man, *while he was
transmitting*, his "radio operator" was spinning the VFO (frequency)
knob. Perhaps it was a manual form of frequency shift spread spectrum :-).

The syndicated TV show "Renegade" mentions scanners quite a bit,
sometimes correctly, sometimes incorrectly.

There are a handfull of digital cordless phones that can be used with
business telephone systems, and offer protection against scanner
users. We have 2 Uniden EXP9100's where I work that offer great range
and privacy. I suggest a look at the Hello Direct catalog for more
info. BTW, Siemans Rolm, Northern Telecomm, and AT&T are also selling
digital cordless extensions for use with their phone switches, but be
prepared to spend some bank.

Would anyone out there consider a trade ?

1) I have a Kenwood TR-7930 2 meter mobile in 99% mint shape. It has 21 memories, factory PL, 25 watts, touch tone keypad on the front panel, nice green LCD display, center tuning LED, reverse and priority LED's, time and carrier scan, mic, mobile mounting bracket and the manual. This radio has NEVER been mobile. It was mounted under a shelf in my shack. I was going to post it for around $200 dollars.

2) Icom IC-24AT 2 meter / 440 dual band handi talkie. Radio is in OK shape, normal wear, numbers on keypad are rubbing off (like the 2at). It has 40 double spaced memory channels, LCD display, up to 5 watts output (12 volt pack) factory PL, 7.2 volt battery (new Oct.95), manual and W&W charging CUP. The 12 volt pack is a LARGE pack (I think 1500ma from Periphex) but one of the slide rails is broken off. It is about 11 months old and is useable. I was going to post for around $225.

I would like to trade EITHER one for a
Radio Shack Pro-2004 scanner or
Trade BOTH for
a 2 meter all mode (digital)
These items should be in good working order and should look good.

What do you think?
Thanks, Mark

Brand new Pro 43 in box. Pre-ban date codes. I bought it 2 years ago when I managed a RS here in town and we still had a few left. Ive honestly used it once since then (I use a Pro-51 all the time).

Its in perfect shape, no mods whatsoever. Make an offer.

Ive also got a Pro 2022 thats been modded for cell. Got the box and dox for it...its in very good shape.

Thanks, Joe

BTW, does anyone know where to get a good leather case for a Pro-51? Something that fits snug like a cell phone case.

812. Advice/opinions on suitable scanner

Newsgroup: rec.radio.scanner
Date: 1996-06-13 00:00:00 UTC
From: agurney@hpsqf.sqf.hp.com
Message-ID: <DsxIFK.DwE@hpqmoea.sqf.hp.com>
Source record: 231866
Cross-posted to: rec.radio.scanner,rec.radio.shortwave

I'm looking for a wide band hand held/portable scanner (to replace a
Sony Pro80).

The scanner must have the following:

SSB - with fine tuning
512 KHz (for Navtex)
Marine Band VHF
utility - around 4MHZ and 8MHZ (WEFAX/RTTY etc.)
AM/FM Broadcast band

If possible, reasonable reception around 137.500 MHZ wide FM for WSAT
and even 200KHZ for LW.

I will be using the receiver primarily for:

decoding WEFAX and Navtex (via JVFAX and HAMCOMM on a PC + various
home brewed stuff on a BBC and Z88)
monitoring Marine band VHF to supplement a transceiver
listening to AM/FM broadcast band and shortwave.

Any advice about suitable models is welcomed - thoughts so far are:

AOR AR8000
Yupiteru MVT7100EX or MVT7200

Thanks,

Alisdair Gurney

Hi 8K folk,

Does anybody know where discriminator output in AR-8000 is located ?
I have found 5 different connectors on PCB. And I heared that
discriminator output is located on one of them.
Need diagram or detaild explanation how to find it(output).

Thanks in advance.
Best regards.

There seems to be some confusion here, so here's my 2 cents worth:

To the best of my knowledge, there are 3 flavors of 900 MHz phones:
1. 900 MHz analog. Easy to monitor with a scanner.
2. 900 MHz Digital. I don't know how to monitor, requires knowledge of the digitizing scheme. The voice signal is digitized, and then sent over a single frequency. Your scanner will just pick up the "buzzsaw" sound (until some hacker figure's out how to decode it).
3. 900 MHz Digital Spread Spectrum. I don't know how to monitor, requires knowledge of the digitizing scheme, and of the "spreading code". Your scanner will not pick up anything (until some hacker figures it out, but it will likely be expensive enough to stop most folks from bothering).

Also, beware of the advertising phrase "Digital Security System". This does not mean no one can monitor it, it means that the handset has to send over a digital authorization code to allow the base to make a call. This will help prevent your neighbors from using your phone line to call there friends in Timbuktoo. It won't stop them from listening in on you.

>hearing a burst avbout every 15-30 sec pretty much all the time. Is this a
>diagnostic/control/test signal or a lot of cars getting stolen around here?

What you are hearing is the signal from the Lojack tower that tells
the mobile lojack transmitter to begin it's squalking.

It may also continue to rehit the lojack device every once in a while
and then finally disable it when the vehicle is located.

If this signal seems to be pretty strong and not moving, then that is
what you are hearing. As far as I know Lojack only utilized one
frequency both for turning on the transmitter and for sending it's
data bursts every second.

Hope I've helped some.

WASHINGTON - Clinton Watson of San Jose, California, who created the "Lifetime Phone" software program used in cloning cellular phones, was sentenced to six years in prison and ordered to pay more than $300,000 in restitution to wireless carriers, according to the Cellular Telecommunications Industry Association.

The U.S. Secret Service and San Jose local police said Watson operated the cloning scam from his home. CTIA estimated the loss from Watson's operations between $1.5 million and $2.5 million.

In other news, Brian Snawder of Omaha, Nebraska was arrested and charged with stealing at least $8,000 worth of airtime. Investigators recovered more than 25 wireless phones and more than 100 combinations of numbers possibly stolen from legitimate customers, according to CTIA. The case is not completed yet.

I would like to hook an external antenna to my scanner in my car.
Unfortunately, I do not want a kajillion antennas hanging off of my car.
Does anybody know a place where I can get a device to use one of my
existing antennas (CB or AM/FM) to receive scanner transmissions.

Is it even possible to hook up a scanner to a CB antenna while the CB
is in use? My CB can output 17 watts, and I would not like to smell
smoke coming from my scanner.

I guess that what I am looking for is similar to those adaptors that
let you use your CB with your AM/FM antenns, just with different
frequencies. Any manufacturer or vendo info would be appreciated.

You could buy an AM/FM splitter for your car radio antenna and run one
to the radio and one to the scanner. It's not the best for recieving
scanner stuff, but, it works. In my experience, it didn't effect my FM
reception at all :)

Most cordless phones made in the past 10 years or so have the above.
It's pretty standard (and necessary). In the old days, people would take
their cordless handset and just drive down the street till they got a dial
tone, then they could call anyone they wanted at the expense of the poor
sucker whose base they contacted. You notice that this hardly happens
nowadays.

Best thing to do, IMO, is take your scanner along when you are shopping
for a cordless phone. Try to listen to the models you're considering
buying. I'm sure the people in the store would be quite interested to
see this.

I use a BC3000XLT scanner and a Radio Shack CTR-45 (?) Voice Activated
Recorder. If the scanner and recorder are too close, then yes the recorder
activates when there's not signal, but not continuously. I have several 1/8"
to 1/8" cables, and some of them don't work properly. My homemade cable
with metal 1/8" plugs seems to work the best (maybe because they are

shielded).

This allows to monitor while I'm away or busy doing something else and compresses 12-24 hours into 45 minutes, depending on the frequency activity. However, you aren't listening to the signals live so you can't tell what time each transmission occured, and seriously scanner enthusiasts consider this cheating!

Stephen

: >The Uniden 9100 Spread Spectrum
: >Digital is an example, though their latest unit (can't recall its model)
: >is NOT a true digital.

By "latest unit" do you mean the EXP 900? it is advertised on the Uniden web page: http://www.uniden.com/product/proinfo/cordless/pi900.htm . I just bought one and it seems OK, but I've only used it indoors near the base so far. It is listed as "EXP 900 Cordless with 900 MHz & Voice Scramble" but it doesn't say what sort of scrambling it has. I bought it because it was half the price locally of the 9100, but I was wondering if anyone knew just how secure it really is. It is described as a digital phone and on the web page it says "Voice Scramble Security - This unique feature scrambles your transmissions for the most secure and private conversations".

Comments anyone?

Would anyone out there consider a trade ?

1) I have a Kenwood TR-7930 2 meter mobile in 99% mint shape. It has 21 memories, factory PL, 25 watts, touch tone keypad on the front panel, nice green LCD display, center tuning LED, reverse and priority LED's, time and carrier scan, mic, mobile mounting bracket and the manual. This radio has NEVER been mobile. It was mounted under a shelf in my shack. I was going to post it for around $200 dollars.

2) Icom IC-24AT 2 meter / 440 dual band handi talkie. Radio is in OK shape, normal wear, numbers on keypad are rubbing off (like the 2at). It has 40 memory channels, LCD display, up to 5 watts output (12 volt pack) factory PL, 7.2 volt battery (new Oct.95), manual and W&W charging CUP. The 12 volt pack is a LARGE pack (I think 1500ma from Periphex) but one of the slide rails is broken off. It is about 11 months old and is useable. I was going to post for around $225.

I would like to trade EITHER one for a
Radio Shack Pro-2004 scanner or
Trade BOTH for
a 2 meter all mode (digital)
These items should be in good working order and should look good.

What do you think?
Thanks, Mark

What's the datecode on your GE SRIII? I picked up a new one recently and it was manufactured the 26th week of 1995.

Atually this is posted in rec.radio.scanners
The origional ad and this entire discussion has noting to do with
SCANNERS.
If you are in this group to learn about pagers, telephones, and small
business then you are off subject.
Reguardless of your feelings about when a notice posted to a telephone
pole becomes an eyesore, The reason the usenet exists is to share
information on specific topis, which is why different newsgroups were
created. The only reason it exists today is because of the common
courtesy of those who preceeded us in newsgroup discussions. If we
allow off topic postings and general spamming, then we may as well
desolve the newsgroups and just have one big massive usenet without
the smaller divisions. This will fall right in line with your concept
that 'you can skip it and not read it, the header is clear'.
Personally I dont care to have to skip over postings that are
unrelated to the newsgroups topic. I did not appreciate the origional
posting in this thread any more than I appreciate all the 'send me $5
and i'll make you rich, quick cash, etc postings. They are unrelated
to the topic!
I agree that bashing the company for their marketing approach is an
inappropriate response to an off topic posting. But to condone it as
somehow remotely acceptable is innappropriate as well.
By the way Ron, I trimmed the newsgroups you posted this to to the one
and only area I personnaly read the origional posting in. If the
origional was origionally posted in ALT.LAW.ENFORCEMENT then it was
really off topic...If not then your reply might have been a bit
confusing to the other newsgroups....

and since we've all spent far more of our own $0.02 than what this
posting was worth, lets let it drop.......or at least confine it to
EMAIL so that others dont have to 'skip over it'

841. VHF-Low used by FBI in Montana?

Newsgroup: rec.radio.scanner
Date: 1996-06-14 00:00:00 UTC
From: hpeach@pop.uky.edu
Message-ID: <4prmpq$27l@service3.uky.edu>
Source record: 231745

While watching the Freemen standoff on the news the other night I noticed a man wearing a jacket with "FBI" printed on the back. He was talking on a hand-held radio with a "rubber duck" antenna about 1.5 feet long. It looked similar to a duck you would see on a CB or low band military radio. Does the FBI have any VHF-Low band suff that they still use?

> AA Nickel Metal Hydride Battery..

If I am not mistaken, I believe that the reason that these batteries have not been offered before under the name of major manufacturers is because of the possibility of misuse and injury. I know that Energizer Power Systems (formerly Gates) makes AA hydride batteries, but refuses to sell them to anybody but OEMs because they can be dangerous if installed in a compartment without ventilation (like a Mag Light). These batteries can vent hydrogen (much more than NiCads) and build up a LOT of pressure

Still, if you know what you are doing, they sound REAL good (pity they're soooo expensive).

They could very well be using any oth e military/local govt freqs used in the 30-50Mhz range. Police depts still use Low VHF and the BATF could've been coordinating/using the local PD freqs if they were Low VHF.

Personally I think they're a bad choice over nicads due to their slef discharge rate. They go dead in less than 2 weeks. OK if yo keep them on trickle charge all the time, but those hazmat issues concern me for safety.

Try searching the 140 to 148 mHz range. This is where the govt hangs
out. Also try the aircraft band freqs. Most books have the actual
freqs for that area.

Well, you can scan pagers, cell phones, and cordless phones. Many of us interested in scanners and other high tech toys own pagers as well!

A lot of cops have pagers! Especially when their department is too cheap to buy them cell phones! My cousin is a cop up in MI, and the only way his

family or friends can reach him when he's on duty (without having to go through his dispatcher) is to page him.

>confusing to the other newsgroups....

852. PRO-2022:Should I Buy??

Newsgroup: rec.radio.scanner
Date: 1996-06-14 00:00:00 UTC
From: carbona@ix.netcom.com
Message-ID: <4psh1a$dif@sjx-ixn2.ix.netcom.com>
Source record: 231756

Hello...
Browsing local pawn shops today i ran across a PRO-2022 still in the box and appearing virtually new for US$140. It seems to get freq's up to the 800's which from what I gather from this newsgroup seem to be desireable. Not knowing anything other than my BC 147XLT doesn't get squat, I was hoping someone out there could tell me if this is the one to go after or avoid. They also had a PRO 51 for the same price but the freq's were covered by a belt clip. Perhaps this would be the better of the two?
Thanks
Chris

>market value (Please Dont Flame, if you dont agree) .

No flame. The BC300 is a great radio and is worth having. I have one
myself. They are about the last radios that you can still work on - many
discrete components. The display goes blinky on some units after a while,
but a 99 cent cap will fix it. Great radio. $175 is about right.

Hello Kevin:

Look at Grove Enterprizes at http://www.grove.net

There is a great catalog of scanner and shortwave stuff, and they have a antenna adapter that allows the use of your AM/FM antenna on your car, for your scanner.

Jay

Yeah. I have one here in West Virginia. The range is not quite 500
miles for me, though, given the mountainous terrain; it's more like
400-450. It's definitely worth the 250 bucks--I save on the cellular
charges, and the clarity is incredible. The FCC is also in the process
of allocating other freq. bands, too, so Deltron will probably up the
simultaneous broadcast frequencies to around 8 or 10. My model is the
2600... yours?

: how can one increse the range of a cordless phone.?

I've gotten extension phone and power cords from Radio Shack and carried the base unit around with me. It works really well, although you'll probably need to get some plastic or something to keep the water off if you set it somewhere outside (if you're working ina field or something).

858. 9000XLT Alpha on All Channels?

Newsgroup: rec.radio.scanner
Date: 1996-06-14 00:00:00 UTC
From: n5off@aol.com
Message-ID: <4psn6c$lg1@newsbf02.news.aol.com>
Source record: 231762

I recently purchased a new 9000XLT. The manual and all the reviews say that the 500 channel rig will only store alpha labels in the first 250 channels (Banks A-J) and the remaining banks (0-9) store only freqs, no alpha.

Well, I discovered by accident that mine stores alpha labels on all channels.

Is this a new feature or is mine "broken".

I'd successfully used one of those microcassette sony
recorders with hi/lo settings on the VOX, works great.
Yes, you do get a lot of tones & squelch openings that
may or may not have any transmission forthcoming. Considering
the alternatives, this isn't bad with a simple patch cord
& $30 cheapo recorder. A good way to catch up on a day's
scanning,especially on one active channel of interest.

The better vox recorders have a vox sens on the volume control.
try setting it so it does not trip when there is no audio.

>P.S. Is there a mod for being able to use the earphone jack and still
>hear through the speaker?

you can home brew one but if you chance your volume setting it will
effect the level to the recorder. The best setup is a scanner that has
a recorder output. Both the R7000 and the pro 2006 have them and they
work great with a vox recorder.

I am looking for an indoor antenna for my scanners. I don't want to mount anything on the roof or in the attic.

Grove sells some antennas which might fill the bill: the Omni II, Grove Hidden, and Grove NoTenna. Has anyone had any experience with these products?

Also, what about the 12" Austin Condor Flex replacement for the "ducky" antenna?

Thanks for any help.

I've heard of a commercial product which will double the scanner
frequency received...ie. scanner set to 460 mhz receives 920 mhz.
Anyone know of it? I was told that internal changes to set are not
required.
Or.. any plans on modifications (not specific to any particular radio)
which will get the same results?

I wouldn't think there would be a problem as long as you verified the
frequencies. Radio Shack has supposedly been known to put dummy
frequencies in their lists so as to trap people and catch them copying
info. That's just what I have heard, don't know if it's true.

873. Alphanumeric Pager Forsale

Newsgroup: rec.radio.scanner
Date: 1996-06-14 00:00:00 UTC
From: Michael Wrighton <wrighton@inet.net>
Message-ID: <31C22D0E.5C0E@inet.net>
Source record: 231777
Cross-posted to: alt.forsale,misc.forsale.non-computer,rec.radio.scanner,rec.radio.swap,alt.radio.scanner

I've got an "Airnote" alphanumeric pager that I'm selling. The pager is in new condition, I don't believe it's ever been activated before. It comes with software for DOS, Windows, and Macintosh to use with the Airnote system. (http://www.airnote.net) I believe it could be used with another provider (particularly Pagenet-their sticker is on the box), as the pager is an "NEC Facts Provider" unit with Airnote stickers attached.

The pager is a four-line unit with clock, 40 message capability (5,750 character memory), three-buttons, and one AAA battery operation.

On the back the unit has the following numbers:
F 929.5625
1547607
04419093 7l

I'm asking $40 plus $3 shipping, but I'll consider any serious offers.

Regards,
Michael Wrighton

There is a mod that adds a hold button. Check the regular mod sites. It
makes a real difference in the usefulness of the counter.

Permit me to do a followup to my own article: The 800xlt runs *awfully*
hot! The power transformer must be undersized for the current the radio
draws. I removed the backup battery case to allow the heat to escape from
the interior of the case. Is this high heat normal?

..si
The channel usage marked with an asterisk (*) are from tables in Icom IC-M2 and IC-M55 marine radio manuals, and are probably fairly "generic", and subject to change in different jurisdictions. Other channel usage is from my station licence for the Canadian West Coast, and from things overheard on the air. "Your usage may vary."

Some of the "Port Operation" channels are used by towboats or commercial fishermen in B.C.

Channels marked (CCG) or (USCG) are for Canadian or US Coast guard authorized stations only.

Channel 70 is supposed to be reserved for a future selective calling system, but is (illegally) being used for intership communications (even by the RCMP!)

The letters under "area" mean:
I: International only (non-US) according to Icom
C: Canadian usage
A: American usage

Channels with an "A" suffix are simplex operation on the ship transmit frequency of an international duplex channel.

Canada uses a "B" suffix to denote broadcast (one-way) use of the shore transmit side of an international duplex channel.

886. BC200XLT Control Knobs

Newsgroup: rec.radio.scanner
Date: 1996-06-14 00:00:00 UTC
From: rbarile@bbn.com
Message-ID: <4prnro$90n@info-server.bbn.com>
Source record: 231790

I need to replace on of the control knobs on my BC200XLT.
The old one came in contast with a hot soldiiering iron an melted. I know that sounds rediculous and I couldn't believe that I actually did that.

Also: I have another probelm with the BC200XT. The antenna connection inside broke for the third time. The wire on the circuit board finally broke and I had a really difficult time soldering in another wire. I finally got it to work after about an hour of work. Is this antenna connection a design defect? It's pretty bad. I was also surprized to see that my scanner retained it's programming after one hour of disconnected battery.

>there a mod for that too?
> john

The cellular frequency "mod" is actually just restoring a capability
that is already there, just turned off.

This scanner never had the capability for the mil air band, nor any
more channels than it already does, so they aren't there to restore.
You also can't reprogram the "band" buttons without rewriting the
system software, which would require a new microprocessor.

By the tone of your question I take it that you are looking for an
easy to implement change. This is not an option in these cases.

888. EAA Fly-in .... Should I take my scanner?

Newsgroup: rec.radio.scanner
Date: 1996-06-14 00:00:00 UTC
From: jps@execpc.com
Message-ID: <4pqeu7$3dm@daily-planet.execpc.com>
Source record: 231826

I'll be attending the fly-in for the first time this year.
Is there enough interesting radio chatter to justify
bringing my scanner along (3000xlt)? What are the most interesting
frequencies to listen to?

On a side note, what is the range for picking up aircraft frequencies
on a portable scanner. I live about 30 miles from Mitchell Field in the
Milwaukee-area, and I don't expect to pick up anything from there. But
I can't even seem to pick up our local airport (Crites Field in Pewaukee).
Do you have to be parked right next to the airport to hear anything?

J.P.

: Adam

From what I hear, no. I had them both briefly but sold my 8000
shortly after getting it. Compared to the R1 it was near deaf,
so I sold it. I wasn't impressed by the construction, although
nothing went wrong with it while I had it.

Using a camera with a flash unit is much faster, avoids mistakes and
gives you all the info that's on their list. Preset the camera's focus
and flash output for around two feet, then move in on the console,
fire a couple shots and you're outta there.

Roger - rwp@westnet.com

Thats why I say fuck the mods for a nice 2006 and set it up to work on some cheep cell phones. Lets stick with low cost recievers rather then fucking with a per. good scanner.

Am I right??? I have bag phones and even an older brick that has the test socket ready for mods. Why does someone not simply modify cell-tracker software from etacs to Amps??? Why WHY?

WHY? WHY? WHY? I CANT but someone out there can??????

WHY?????? WHY????? Why not??? That is all I ask for gods sake.

Take it easy boys!

MrCodeGrabber. Tanxz~ya

>permission from the telephone company. You are also taking advantage of
>the fact there's a road nearby. And you sign is creating an eyesore for
>everyone driving by.

Eye sore? Maybe you have a point...but this not a telephone pole.
YOU HAVE A CHOICE read or don't read. The headder was very clear.

This telephone pole has a directory on it and it tells you whats on
it,from far far away. Just like on this newsgroup. But on this
newsgroup its called the SUBJECT or SUBJECT HEADDER

Its not an eye sore unless it's posted on a regular basis and
unless you turn this difference of opinion on what belongs here into a
company bashing agrument. Stick to the point.

>If you saw someone advertising on a telephone pole for say, carpet
>cleaning, would you invite those people into your home? Or would you
>prefer to do business with someone who has enough money to buy a
>quarter-page in the Yellow pages?

How do you think these companies got into the yellow pages? Money
was just handed over to them? Is this how you uasualy shop? The
bigger the ad the better the product? (remember its not the size that
counts!!!!)

Back to your first argument. You do remember that right? It was
about posting commercial messages in newsgroups. Forget about how
much money a company has etc.

I subscribe to this newsgroup to keep up to date and share
information about anything related to radio and communications. A
telephone is a communications device, A call dispaly unit is a
communications device. So is a pager. What this product seems to be
is something that connects all three together. It is of interest to
me and I think to some others also.

I know its an ad. but its something New, I never heard of it before,
and am interested to know about it. This is why I do not agree with
your firt point.

Even though the companies sole purpose "may be" putting it here for
the sake of just advertising, fine. It is of interest to others in

this newsgroup.

Sorry I do not agree with you. You have to support your agrument
better and NOT by bashing the company.

> Even if the price was a little
>higher. To me, the choice would be obvious. An advertisement on a
>telephone pole is an announcement that the person putting it up there
>doesn't really have enough capital to run their business right.

Again you have a choice.

Capital?!! sure, here we go again.

Are you angry that an ad is in this newsgroup?

If so then your agrument should then support the reasons why it
should not be here.

NOT how one should run a business.

Todd Hargis wrote:
>
> If anyone has the current active freq. for the Indiana State Police I
> would appreciate it if someone could e-mail them to meTodd,
I left the ISP in '88. They were then using 42.42 for base xmit.
42.26 was the main mobile call in freq with 42.40 as a secondary. 42.12
was used as "three-way" or car-to-car. 42.16 was used as "tach 4" for
special details. 42.20 was used by some of the units for narc work.
On VHF they used 155.37 as point to point. ILEEN on 155.475 and the
mobile/base/portable repeater system operated on 155.445. They were just
switching over to programmable Motorola units when I left so they can
probably put any freq they want in for any detail they have (until the
FCC catches them at it).

HELP! I'm despreate!

I have a MX340S. This radio has 4 zones of 12 channels.
It is currently set up for 1 DPL and approx 19 channels... If
anyone could reporgram it for a couple TPLs and 24 channels?!?!?!

I will pay you to do it and shipping if needed....

Matt

904. Any legal issues in keeping scanner frequency lists on a www page?

Newsgroup: rec.radio.scanner
Date: 1996-06-14 00:00:00 UTC
From: sdo@msn.com
Message-ID: <4pri6q$k95@mrnews.mro.dec.com>
Source record: 231842

Hi,

I'm thinking about spending some time and pulling together all of the motor racing frequencies I can find and keeping updated lists on a www site. There are a few sites out there with scattered lists of racing frequencies, but none that I can find that are at all comprehensive when it comes to motor racing.

My question is this... are their any legal issues with copying frequency lists from such places as: The Radio Shack books, frequency manuals from companies like Race Scan and Racing Electronics, other www pages? I can't imagine that those places "own" the rights to the lists as the frequencies are public information.

Obviously, I wouldn't want to just copy verbatum, but instead use those lists as a baseline and update as necessary.

Any thoughts on this?

Thanks,
Steve

Here's a good one, for starters:

45.30

It's Orange County Police Helicopter Coordination, or something like that. Many OC Police Departments don't have their own choppers, so the few that do share amongst themselves and others. There's a lot of good listening on this frequency.

Also: 460.025

This is also called "CLEMARS 'Gold'", and is essentially Orange County's equivalent of LAPD's old "Tac 1" for "hotshot" calls. You'll hear bank robbery broadcasts, freeway chases, lots of stuff!

Ok, this is the USA and we're all entitled to make a living.
There is money to be made selling frequency "lists" and I have bought
my share over the years. Problem is that much of the information in
the "lists" is outdated. Sure there might have traffic on the
frequency years ago but is it in use NOW?

I would like to share information with anyone who is actively engaged
in the ever shrinking monitoring hobby who would like to share info
about what they have PERSONALLY been hearing TODAY or THIS WEEK.

Of course I realize that VHF or UHF radio from California would not be
heard here in Ohio, except for low band skip (come on sunspots!!!) but
I would welcome you're shortwave or satellite info. Sorry about that,
but I am sure that someone would be quick to point out the obvious.

The internet is perfect for sharing near realtime and realtime
information. Those of us with IPHONE or a simmilar program could share
realtime audio. What are you listening to? Maybe start an IRC channel?

I'm particularly interested in UHF and satellite military air,
shortwave air and any voice or data to be found on the commercial Ku
band satellites.

What do you think? Let's share----us015593@pop3.interramp.com

Thanks for reading this.

Source record: 231648
Cross-posted to: rec.radio.scanner,alt.radio.scanner

From the FAQ "Buying a Used Scanner:"

PRO-2021: Base/mobile scanner. 200 channels in 10 banks,
LCD display and raised rubber keys. Lots of memory but
scans too slowly and lacks 800 MHz. Ten "monitor" channels.
Radio Shack seemed to have an overstock of 2021s as they
were on sale for such a long time. Close out price dipped
to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but
includes the 800 MHz band. Cellular images throughout the
847.6 - 869 MHz range. Includes power saver circuit, odd
for a base unit, which can clip the first part of a
transmission.

>[I] programed my favorite frequencies. Nothing. Only static. I can't
>even pick up the WX broadcasts. Everything else works find -
>just no sigs.

Did you check your antennas or antenna jacks?
The center sleeve of the Motorola-automobile-type antenna
jack can become enlarged and fail to make contact with
the mail pin on the antenna. You can carefully crimp the
center sleeve a bit tighter using a long nose pliers, but make
sure you pull the antenna out of the jack first.

>.... The 800xlt runs *awfully*
>hot! The power transformer must be undersized for the current the radio
>draws. I removed the backup battery case to allow the heat to escape from
>the interior of the case. Is this high heat normal?

Normally, the power transformer is uncomfortably hot to the touch.
How hot is that?

After running my BC800XLT 24 hours/day, I removed the
cabinet and measured a power transformer temperature
of 121 degrees F. My temperature probe was touching the
center of the metal U-frame, on the TF318 marking and the
radio was powered during the measurement.

If your transformer measures a much higher temperature,
find out if something is drawing excessive current in
your BC800XLT.

In article <4pss6u$mva@newsbf02.news.aol.com>,
Daren349 <daren349@aol.com> wrote:

> I am looking for a good source for frequencies....

From the rec.radio.scanner FAQ article:

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (708)554-3839 6-10 PM central time. For a brochure, send SASE.

RadioMap has been favorably reviewed:

"... one of the most interesting reference products I've seen... ... an excellent reference tool." - RCMA Scanner Journal

"... truly an innovative product." - USSN

"...a Must Have!" - American Scannergram

Notes:

1) RadioMap is a trademark of Robert Parnass.

2) I cannot respond to electronic mail inquiries about RadioMap, so please call me some evening at the telephone number above if you have questions.

>Or.. any plans on modifications (not specific to any particular radio)
>which will get the same results?

It is called a down converter. It actually subtracts 400MHz from the freq, so you can tune in 870MHz at 470MHz on your scanner. You put it between your antenna and your scanner. You can buy kits or assembled units. Kits are about $50 and assembled units are $90 - $100. Tucker (1-800-559-7388) and Grove (www.grove.net) sell them.

Assuming your antenna system from the connector at the radio up to and including the antenna is OK, it sounds like you bought a dud 2006. As many as they made, there is always bound to be one or two flaky ones produced. The reputation of the 2006 would indicate that the individual radio is the problem, not the design. Take it back for a refund or to the shop. It should work fine.

If I'm not mistaken, the receiver would need an IF filter of
about 20 kHz to pass the signal to your device(which I assume
is built upon either the 4046 PLL chip or the UMF1000T chip).
To my knowledge, not a lot of scanners have an IF filter that
wide. How do you plan on dealing with that while keeping the
kit simple?

You might want to check title 18, US code. I'd imagine that the
legal trouble you are concerned about would originate in the US.
Just from taking a quick look at it, I'd say your chances of
finding a loophole are pretty slim.

: >Hi, I modified my PRO43 about 6 months ago for cell. In the process of
: >desoldering the diode D3, I broke it. I needed it to restore the TV and
: >radio
: >bands. Does anyone know the value of the diode, so that I can replace
: it?
: >
: >

: Well, the specs on the diode aren't critical for this application. I
: believe RS sells a pack of small diodes that look virtually the same as
: the one you broke. I used them in my PRO-34 to try to unlock some other
: bands besides cellular. Just need one with a foward voltage of about 0.7V,
: a reverse breakdown of over 10V or so, and max current in the mA range. I
: think you'd be hard pressed to find a small diode that wouldn't work!

: A word of warning here: putting in a diode to unlock other bands (besides
: cellular) will probably not work. The RF circuitry is there to tune the
: cell freqs, but the law requires them to be blocked. The other freq gaps
: are there due to RF circuitry limitations, not due to legal requirements.
: So, other than the cell gap, the scanner won't have the RF section tuned
: for that freq range. To get the other bands (ie the European version's
: bands) the RF section needs to be tuned differently (ie you need to trade
: a current band for your new one). And on some scanners (mine!) the mod
: unlocks the European band and locked out a US band, you could not have
: access to both! So my scanner accessed the new Euro band, but didn't tune
: in anything, and the US band I could tune, I could no longer access (Hell
: of a mod)! I suppose it can't hurt to perform such a mod if you don't
: loose a band, but I have found it pretty useless.

: PKH

Unlke the pro-34, you don't lose the US low band, when you enable the
European mid band.
As for the performance, while it will not be quite as good as if the
front band was tuned for mid band, for non-critical uses, it will work
adequately.

You don't mention your location, so it's hard to tell whether there
is any book that will fit your needs. The FCC has nothing to do with PL<TM>
tones, so you won't find that info in their database. Scanner Master books
generally have the tones, if you can find one for your area.

For Sale: Uniden scanner, model BC300 (newer model),
also same as Regency INF-7
Has 10 channels that are programmed from a service search of built
in library of frequencies for police, fire and medical.
Also features an instant weather button and WEATHER ALERT!
Runs on 12vac or 12vdc, includes an AC adapter and antenna.

Sold for $100+ new. Asking $45 firm, I pay shipping. Payment by
postal money order only. No trades.

Tom, N0YGT

Remember that cellular was first deployed in the early 80's. The technquies for cloning, snarfing, etc. were much more difficult for the average hacker back then with that day's technology. At that time, they probably thought the system was secure.

Remember the phone phreaks of the 70's? Back then, all it took was a box which generated a few simple tones and you could call free anywhere in the world.

It doesn't double the frequency, it shifts it down by 400. So you would
tune to 520 to pick up 920. Ramsey makes these in kit or assembled form,
GRE makes them, too. They are easily bought at ham-radio type stores.
Look at the ads in Pop Comm or Monitoring Times.

Source record: 231722
Cross-posted to: rec.radio.swap,rec.radio.scanner,alt.law-enforcement

Everyone else has posted their $.02 worth on this topic, so here comes mine...

First, as an ex-carny, I resent the implication that businesses that advertise on telephone poles are cheap and disreputable. The telephone pole (originally telegraph pole) is a traditional method of advertising for businesses that use showcards and "paper" towns, such as carnivals, circuses, theatrical shows and politicians.

Hmm...maybe I should withdraw my resentment ;-)

Someone mentioned many policement use pagers, so posting the ad to law enforcement groups would be appropriate. That's true. In my sheriff's department (I'm a civil deputy), we all carry pagers in case we're needed for emergencies (for example, I'm on the ERT and in the Mounted Unit).

As for spamming in general, why shouldn't any company take advantage of an opportunity to target a promotion at little or no cost? That's just plain old good business sense. If you don't like reading it, don't read it. There's no requirement to read everything posted on the internet, just as there's no requirement to read every (or any) ad in a newspaper or magazine.

All those who agree with me, please send you non-deductable donations to...

What the heck...if people feel obligated to read everything on the internet, maybe they'll feel obligated to do what every post asks them to do, including send me money!

;-)

Source record: 231733

This past weekend I installed an Opto OS535 into my Radio Shack Pro-2035. I am unable to tune the scanner to any frequency between 520 and 760 MHz. (UHF TV Band). The scanner displays Error in the display when I try to enter these frequencies from the front panel on the scanner. When I use Scan*Star Plus the software reports a scanner error.

I am not sure that the scanner could tune these frequencies before I installed the OS535.

Does anyone have any advice as to what could cause this. Could a wire in a connector not making contcat cause this?

Thanks Wes Mangum
wmangum@vnet.net

Hi J.P.,

I'm an Australian, so you'll have to excuse the use of kilometres, I'll try to convert it to miles.

I live in Melbourne, roughly 30nm, 55km, 35miles from Tullamarine (Melbourne Airport). On a good day, with my homemade indoor antenna, I can hear the ATIS broadcasts from that field, but not the Tower, Ground, etc... I can't hear the Approach or Departure controllers either, but at night these broadcasts are all simulcast on another frequency, so I can hear them!

I asked the same question once, and the reply was that you'd want to be withiin 10nm, 18km, 16miles to hear anything worthwile. It also depends on how many hills, obstructions, etc... there are in between your receiver and the transmitter.

The local field, Moorabbin Airport, is about 6nm, 12km, 8miles from my house, and with the antenna, I can hear all communications except for the aircraft when taxiing around the airport. Using the portable antenna which comes with the scanner is useless!

Se ya later!

I recently upgraded my scanner from a Radio Shack PRO-2030 to a PRO-2006 =
with a OS456 board (not a casual purchase). Well, I thought it was an =
upgrade. I'm a little surprised (disappointed) considering the rave =
reviews I've read on the 2006 from industry luminaries and others. As =
it turns out the 2006 just doesn't perform as well as the 2030. I do =
have a roof mounted scanner antenna. Specifically, in the 43 to 47 MHz =
range, the 2006 doesn't seem to pick up as many transmissions as the =
2030. Those that the 2006 does pick up definitely have more static and =
just don't sound as well. The 2006 won't even pick up my own cordless =
phone when I take it off hook. The 2030 had no problem what so ever =
with this.

Hi Ron; So where do you suggest we draw the line regarding commercial ads on here? If it's okay to allow one company to advertise, will it also be okay to allow 10? 50? 1000? What if every radio dealer in the US wanted to place ads on here? Is "good taste" your only criteria? I vote *no* to any and all commercial ads on the recreational newsgroups, for then they'll become as uninteresting as the Yellow Pages. Jeff KH2PZ

>

All gaps, except the cellular gap, on RS and BC scanners are there due to RF circuitry limitations. These gaps are there to make the RF board less expensive, not because of legal requirements. Some scanners can be modified so that the microcontroller will "tune" in another band, but if the RF section is not tuned for that band, you won't get anything!

Source record: 231604
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I would like to trade EITHER one for a
Radio Shack Pro-2004 scanner

1) I have a Kenwood TR-7930 2 meter mobile in 99% mint shape. It has 21 memories, factory PL, 25 watts, touch tone keypad on the front panel, nice green LCD display, center tuning LED, reverse and priority LED's, time and carrier scan, mic, mobile mounting bracket and the manual. This radio has NEVER been mobile. It was mounted under a shelf in my shack. I was going to post it for around $200 dollars.

2) Icom IC-24AT 2 meter / 440 dual band handi talkie. Radio is in OK shape, normal wear, numbers on keypad are rubbing off (like the 2at). It has 40 double spaced memory channels, LCD display, up to 5 watts output (12 volt pack) factory PL, 7.2 volt battery (new Oct.95), manual and W&W charging CUP. The 12 volt pack is a LARGE pack (I think 1500ma from Periphex) but one of the slide rails is broken off. It is about 11 months old and is useable. I was going to post for around $225.

Thanks, Mark

I don't think you can call overseas with a pile of "quarters" deposited
with your hacked Radio Shack tone dialer. Live operators normally come on
for intl. calls, don't they? They know how tell red box tones from real
money being put in the phone.

982. AR8000, Optolinx, CAT-232, which?

Newsgroup: rec.radio.scanner
Date: 1996-06-16 00:00:00 UTC
From: slwork@netcom.com
Message-ID: <slworkDt3MrF.6Kn@netcom.com>

Cross-posted to: rec.radio.scanner,alt.radio.scanner

I am wondering which computer interface is better for the AR8000?

A) Optolinx (formerly CX12AR)
B) CAT-232
C) None of the above

The AR8000 has one of those awful N-pin flat connectors inside the battery pack, not any type of phone jacks.

The CAT-232 seems to be quite simple, it just has an RS232 on one end and the radio connector on the other, goes for $99.

The Optolinx seems to me to be overkill for the job, it costs $129. Plus you have to plug it in (for power).

The only advantage I could see for the Optolinx is that it *might* bring the squelch signal from the radio to the computer. I don't know, I'm asking. Supposing you were trying to use ScanStar to log frequency hits would having this capability help you.

I guess neither of these has a replacement battery cover for the radio, you have to have it off when you are connected to the computer. Is this correct?

You sure that phone is made by Nokia? Tandy was building their own version of Nokia phones in Korea. It was manufactured under license from Nokia but it was not Nokia built phone. This was the case when they are building the Nokia/Mobira clones a few years ago.

--------------------------------------------------------------------------------
If you don't mind me butting here "Dr. Pepper" I would like to propose
the following as a much better and more broader frequency range for him
to search for local Feds and military:

30.000 - 30.560 US Government
32.000 - 33.000 US Government
34.000 - 35.000 US Government
36.000 - 37.000 US Government
38.000 - 39.000 US Government
40.000 - 42.000 US Government
```

138.000 - 144.000 US Government - land mobile (25 kHz steps)
148.000 - 149.900 US Government - fixed/mobile, satellite
149.900 - 150.050 Satellite - radionavigation
150.050 - 150.800 US Government - fixed/mobile
162.025 - 174.000 mainly US Govt - land mobile (12.5/25 kHz steps)
225.000 - 328.600 US Government - Aero (50/100 kHz steps - AM)
[243.000] Aero - military emergency
335.400 - 400.000 US Government - Aero (50/100 kHz steps - AM)
400.000 - 406.000 US Govt - Meteorological / Space
[404.370] Wind Profiler radar
[406.025] Emergency Locator Transmitter (ELT)
406.100 - 420.000 US Govt - land mobile (12.5/25 kHz steps)
932.000 - 935.000 US Govt - low-capacity fixed links (FAA)
941.000 - 944.000 US Govt - low-capacity fixed links (FAA)
960.000 -1215.000 { Aero navigation - DME/TACAN (w/ assoc. VOR)
{ US Govt - Joint Tactical Info. Distrib. Sys.
1215.000 -1240.000 US Govt - GPS Radionavigation Satellite
1350.000 -1400.000 US Govt - military tactical & air-ground data

Researched, assembled and made available by F. Barry Mulligan,
mulligan@acm.org, with an effective date of June, 1996.

The above is based entirely on a summary of the FCC Table of Frequency
Allocations, based on the Code of Federal Regulations - 47 CFR 2.106,
with additional information from the NTIA channel plan, et.al.

I hope this helps and provides a more detailed analysis of the federal
spectrum for scanners and listeners.

: This past weekend I installed an Opto OS535 into my Radio Shack Pro-2035.
: I am unable to tune the scanner to any frequency between 520 and 760
: MHz. (UHF TV Band). The scanner displays Error in the display when I try
: to enter these frequencies from the front panel on the scanner. When I
: use Scan*Star Plus the software reports a scanner error.

: I am not sure that the scanner could tune these frequencies before I
: installed the OS535.

The 2035 never was able to tune these frequencies. Not a legal
requirement, a hardware limitation. Besides, you can always get a really
cheap TV set which gives you sound AND picture.

If what you have on your mind is restoring the blocked-out channels, you aren't going to get very far with the radio alone. However, if you spring $300 or so for an OS565 computer interface, and do major surgery on your radio to install it, then you can enter a 20-digit unlock code.

: providers??

If you knew how many pounds that "digital scanner" cost, you'd realise
that hardly anyone can afford it. Besides, the scanner could be digital
(it does have digital parts inside) but it could be monitoring analog
phones. Besides, some digital cellular protocols are not secure, such as
the TDMA used in some places in the US.

I too have created a unique way to to follow cell calls on a pro 2006!
It is a very simple procedure and takes only 12 minutes to add.
1 problem is that it must be done at my workbench.
If you would like this upgrade I will do it for free.
Just send me your scanner (postage pre paid) and i will modify and
send it back with in 2 days. Oh by the way this procedure will destroy
certain scanners with a man date of 7-91 thru 7-94.
If this happens I can not return the scanner but I will send you a
note and a death certificate.
Just e-mail me and I'll give ya the address.

Warning- This post is not to be taken seriously.
This is a joke, prank and a mocking the worthless original post.
But if you like u can send me your scanner anyway.

Believe it or not, it would not be composary for those who own 2006's to do
the mod' , we are all (hopefully) free to choose.
I see that many have already 'fucked' with a perfectly good scanner to get
the cell band in the first place, this would just be another step for the
hobbiest.

It isn't too hard to get the same thing working on a mot' bag phone, however
you do need to access the clock and NRZ data lines, which are not available on
the external socket.

Just think Rog, If you get a case of gadget fever, you can pop over to the WEB and search for what ever you like. This marketeer on the other hand has used the technique "present the product to those who will drool". And you drooled. You lose.
I hope "(Infigety) Paging" and ALL other marketing spamers come to realize the potential market they are loosing simply because they are irritating.

The difference between marketing and providing interesting information
is a fine one.
Personally, I am happy to be given the chance to decide if I am
interested.
If I am not I will ignore it.
We get a lot of requests for this sort of advice...why complain when
it is volunteered ?
Brian

RON,
Buy a clue. "Infinity" admitted it was not the manufacturer but the
retailer (marketer).
If the manufacturer had posted information about the workings of the
equipment that's OK. A marketer on the other hand will tell you any thing to
sell product. This is useless drool bait.

I think Ron Bought one.

Last night I was receiving VERY strong signals in the high VHF and the UHF bands from 100 to 125 miles away! Though this has never happened for me before, I believe the phenomenon is called "skip"? Can anyone tell me how often skip might occur, and how long does it last (more than one night)? Can it bring in stations much farther than 125 miles on these bands?

There was a court case a few years ago that said that data could not be copyrighted, just the manner in which it is presented.

This was over phone books, should apply to frequency listings. Just list the frequencies and who they are assigned to and you should be safe. Any additional information you include should be yours or from public domain sources such as the government.

Your local library should have information on the above mentioned case.

1016. StarTeck Frequency Counters

Newsgroup: rec.radio.scanner

I am looking for info on The StarTek Frequency Counters. I have an opportunity to buy the ATH-15 at a reasonable price. Can anyone give me a review of their experience with this model or the StarTek products in general. I know that this frequency counter does not have many of the same features as the Opto Scout (it also costs alot less) but can the ATH-15 be used in the same manner understanding that the frequencies will not be save into memory wh they are captured? Thanks, Rob

:>
:>I have an ICOM R1 (unblocked original version) and was looking at the
:>AR8000. Does anyone have an opinion on a comparison? I know the specs
:>on the 8000, but is it as durable as the R1? Any help would be
:>appreciated! Thanks!

Own them both, I was orignally going to get the AR8000 instead of the R1 but then I found it on sale for $350 which is why I got it. Two years later I finally got the AR8000, the AR8000 stomps the R1 big time. The R1 is like a pickup and the AR8000 is a Mustang.

The AR8000 has computer control, which makes it very nice for programming. I would have a hard time living without the alpha tagging espically with 1,000 memory channels to play with. I have more programmed in the AR8000 than the R1 will ever see, simply due to the alpha tagging.

Reaction tune is fun also (if you own the scout). You're looking for the frequencies used by a company, you just wait until you hear the right stuff, and then sit on it. Sure makes it a lot nicer than scanning a group of frenquencies, or trying to punch them in as you get hits.

1018. Calgary Frequencies

NiMH AA cells are available from E.H. Yost & Co. (Mr. NiCAD 608-831-3443)

They cost $ 3.50 each + S&H. Capacity is 1,100 mah, about twice NiCads.
The recommended charge is about 10% of rated capacity for 14 hours.
The AR8000 wall charger seems to work fine, no heat or smoke. Just be
sure not to overcharge.

I have been experimenting with different antenna's for this
scanner, but I cannot find one that works better than the stock antenna.
The stock antenna is about a foot high, and the reception is okay, but not
as good as I would like. If anyone has one setup or know's of a good one
please let me know. Where I am located is sort of a radio hole, so it's
really hard to get a signal in out out.

Thanks alot
Chris Valliant

G'day Steve, how would y'be?

I am almost ready to release "Channel Commander" V2.0 s/w that will do
that job for you. It should be ready in a couple of weeks.

It is also a "button pushers delight." with upto 250 user definable
channels in groups and catagories. Buttons with user definable
captions (alfa tagging) with upto 25 characters. Comments fields upto
45 chars etc etc

Ideal for very fast and snappy channel hopping!

Release price UKP 30, (NZD100, USD100) plus p&p

I also have a very low cost (UKP 25 plus p&p) computer interface
kitset available for the AR8000 and AR2700 - Everything included to
make up the proper job. Including the special ribbon cable to plug
into the AR8000/2700. All you have to do is supply a 25W soldering
iron! (I can even supply it built & tested if required!)

Email me for more info on the software or the interface if you are
interested. I am happy to ship it out to you

My love to the Windy City!

Hello Steve,

On the face of it, It does seem a lot, but don't forget the rest of
it.

I have produced a kitset here in the UK which I sell for 25.00 UKP
plus postage - I guess that might translate to 75 - 100 bucks

The chip inside only costs a couple of pounds, But by the time you add
the double screened high grade computer cable (2 metres), the special
flat ribbon cable for the back of the radio, the metal diecast box to
put it in, the computer 9 pin or 25 pin "D" connector, all the other
bits and pieces, (strip board, capacitors, resistors, solderpins,
mounting pillars, heatshrink etc etc).

Together with a complete set of working drawings and a step by step
instructions .... Believe me, there is no profit in it. I don't do it
as a commercial enterprise - I only do it as a service to the
AR8000/27000 fraternity....(I have access to electronic components at
trade and am very interested in computer control and software.)

Without the special AR8000/7200 flat ribbon cable, the unit is a
regular interface that will control any radio (or other equipment)
that has an RS232 port at TTL logic level.

If any one wants more info on my interface kitset, Please email me & I
will send more info. (I haven't as yet sent one to the US, but I
guess there is always a first time!)

Happy scanning to you all...

>--

> --- Judy May hq124@cleveland.freenet.edu

Hello Judy

Yes, the VHF skip is capable of extreme ranges.

It is a phenomanae that comes and goes seasonally as well as on a
"weather" related way.

Experts could fill many pages with explanations but very it is to do
with the various (Appleton?) layers around the earth. Don't worry or
bother about the technical reasons, Just enjoy the effect!

The "lift" conditions can appear almost at any time, but more often
in the sumer due to higher probability of settled weather associated
with the high pressure.

The effect can last from just a few seconds or it could last for a few
hours. The hams call it "Sporadic-E", Cbers: skip, but commercial
radio operators call it a PIA!

Hint: Watch the TV weather reports. When there is a big High pressure
area and settled weather, there is a likelyhood that a "skip" or
"lift" conditions will come into effect. That is the time to start
looking for long distance stations (DX) (I dont know if they do it on
the US TV broadcasts, but when a big lift is on, in England, TV
interfearance is likely. The TV bradcasters put out message , words to
the effect "Some viewers are experiencing interference. This is beyond
our control" This is the time to listen with hopes....

It always starts at the lower frequencies, and the stronger it becomes
the higher in frequency the effect can be noted...

I personally have recorded 400 - 500 miles in Europe. I live in SW
England and logged VHF stations in Norway, Scotland, Ireland, France,
Germany, Switzerland, Spain, Portugal and Italy. Recently (about 2
weeks ago) In the UK we could hear East european FM stereo broadcasts
on 70 - 80 Mhz bands (ruski broadcast band!)

Admittidly I have been messing with radio for 30 odd years, but keep
your ears open, and you will sooner or later hear the extreme long
distant stations...

Happy DXing....

Regards

Yeah, right. No doubt they "estimated" this "loss" by assuming
that, if cloning software didn't exist, everybody who had cloned
a cell phone would have gone right out and paid for a second
account just so they can get a second phone.

If the cell phone companies want to stop people from cloning,
the solution is simple: allow customers to use more than one
phone on an account. As long as they keep trying to fleece
their customers, a lot of them are going to find ways around
it.

Cross-posted to: rec.radio.swap,rec.radio.scanner

I have a copy of the Massachusetts Scanner Master 5th Edition (the one
that currently is available for $30.00) that I am no longer using and will
sell it for $20.00 plus postage. Any interest?

Michael Crestohl,
mc@shore.net

{snip}
CORRECTION:
Due to a couple of enquiries from the USA, I have got the rates of
exchange and airmail costings to the USA.

The AR8000 inteface, delivered airmail to the USA:

Full Kit of components, drawings and detailed assembly instructions
for homebrew = USD50.00
Unit built and tested = USD75.00

(Includes "D" connector and special flat ribbon)

Email for further info... Thanks

D.Gray@AutoComm.CityScape.Co.UK

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1996 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the
RCMA Newsletter, December 1988. It may not be reproduced
in whole or in part on CDROMS, in bulletin boards,
networks, or publications which charge for service without |
permission of the author. It is posted twice monthly on |

ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is
difficult to use because of too much hysteresis. The
American Heritage Dictionary of the English Language
defines hysteresis as the:

o "Failure of a property changed by an external agent
to return to its original value when the cause of the
change is removed."

It's like having play in a car's steering wheel, or
backlash in a gear set. Too much hysteresis in a squelch
circuit forces one to keep the squelch at a tighter
setting, missing weaker signals when scanning or searching.
The squelch hysteresis problem was first addressed in a
1984 article about the Radio Shack PRO-24 crystal
controlled scanner.

Why do engineers design these circuits with any hysteresis?
Basically, hysteresis prevents weak signals from "popping"
the squelch open and closed rapidly, which would be very
annoying to the listener. A squelch circuit with hysteresis
requires a stronger signal to open the squelch than it does
to keep it open.

Models cursed with too much hysteresis include the
Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003,
PRO-2004, and others. Don't despair, the fix is simple for
most radios. I've successfully reduced the squelch
hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation, (317)326-4419, is
able to effect repairs on some older (pre-Uniden) Bearcat
scanners. They sell crystals, antennas, power cords,
owner's manuals ($11 ea). Electra Corporation is located

at 251 N. 300 W. Greenfield, IN 46140-8496.

Some schematic diagrams may be obtained from Uniden/Bearcat's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges. The phone number for repair is also (800)297-1023.

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from

"on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

|>$175 or Trade for any Programable Handheld Scanner with at least 108-134
|>Coverage.

|No flame. The BC300 is a great radio and is worth having. I have one
|myself. They are about the last radios that you can still work on - many
|discrete components. The display goes blinky on some units after a while,
|but a 99 cent cap will fix it. Great radio. $175 is about right.

You must be kidding; this is a really, REALLY old scanner.
It's over 13 years old. It has a 10Mhz IF, so prepare for images galore;
the frontend is easily overwhelmed by Pager signals. The SEARCH function
scans in only one direction; I seem to recall that it has only 50 channels
or so. No 800Mhz. You got to figure the preprogrammed buttons are or have
gotten obsolete. I sold mine years ago so I could get a Rat Shack PRO-2004.
The flourescent display is very nice, with it's rolling zeros and built
in clock and hit counter on a per channel basis, but the background noise
generated by the display drivers get's fatiquing after awhile. I sold mine
I think for around $120 about 9 years back.

Bottom line is that's it's a nice antique scanner, but not a choice scanner
for today's RF environment. Whether it's worth $175 considering that new
Uniden BC-760XLT's are going for $170 is an interesting question for potential
purchasers...

Abstract

This article contains product review summaries for more than
60 old and new scanner radios and monitor receivers. Other
topics include:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other
radio hobbyists. This article describes a few of the FM
receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Grove Enterprises (Brasstown, NC) and Radio Shack repair scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both

tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 , Bearcat BC-101 , and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company
201 Blackford Ave.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews of these scanner models
in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004
Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037

Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Feb 1996 - Radio Shack PRO-2042
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jul 1996 - Uniden/Bearcat BCT-10 mobile |

Note: Reprints of Monitoring Times articles are available for $2.00 each (plus self addressed stamped envelope) from Grove Enterprises, PO Box 98, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this $2.00.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

ICOM

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of

Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal

lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. See "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC230XLT (Uniden): See BC220XLT.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the

part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none.

Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout

Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility

indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a transmission.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay

is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-26: 1985 vintage. Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring

parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-62: 1984 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal

case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2526	10	X		yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (708)554-3839 6-10 PM central time. For a brochure, send SASE.

HAMFEST/COMPUTERFEST CALENDAR 1996 - NORTHERN ILLINOIS
last updated June 1, 1996 |

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (708)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale and ARRL for providing some of the information.

JUNE

June 2 (Sun), Princeton, IL - Starved Rock RC. Bureau County Fairgrounds. Admission $5, free parking. Info: Debbie Burton, N9DRU, 1153 Union St., Marseilles, IL 61341-1710, tel. 815-795-2201 Usually an excellent hamfest, with sellers from Illinois, Iowa, and Wisconsin.

June 9 (Sun), Granite City, IL - Egyptianfest '96, Egyptian Radio Club. Granite City campus of Belleville Area College, 1/2 mile south of I-270 on Ill Hy 203 at Maryville Road. 8:00am to 1:00pm CDT. Annual hamfest, computer fair and fleamarket. VE session, food and drink, indoor dealer / exhibitor area. Talk-in 146.79 MHz. Info: Egyptian Radio Club, P.O. box 562, Granite City, IL 62040, call Bill Dusenbery N9OQK at (618) 398-1456.

June 30 (Sun), Wheaton, IL - Six Meter Club of Chicago. DuPage County Fairgrounds. Outdoor and indoor flea markets. Gates open 7 AM. Buildings open 8 AM. Admission $5 at gate. Talk-in on 146.97 MHz (107.2 PL) or 146.52 MHz. No booze allowed. Tickets available from Mike Corbett, K9ENZ, 606 So. Fenton Ave, Romeoville IL 60446. 24 hour hotline for info (708) 442-4961. Good hamfest which moved from Santa Fe Speedway to Wheaton this year. *

Jun 30 (Sun) - Computer Central, College of DuPage (see notes at the end of this article).

JULY

Jul 13 (Sat), Oak Creek, WI - S. Milwaukee ARC Swapfest. American Legion Post 434, Shepard Ave. Admission $5. Talk-in 146.52 MHz. Info (414)762-3235.

Jul 14 (Sun), Sugar Grove, IL - Fox River Radio League. Waubonsee Community College, Rt. 47 at Harter Rd. VEC test-

ing. Admission $5 at gate, free parking. Info: Diana WD9API, (708)293-7485. Fair, small to mid-sized hamfest.

Jul 27 (Sat), Pecatonic, IL - Rockford ARA Hamfest. Winnebago County Fairgrounds. VEC testing at 1st Baptist Church, 7th & Washington. Admission $5. Kids 10 and under free. Info, Marsha Plasters (815)399-9233 or Diana White (815)645-8545.

Jul 28 (Sun) - Computer Central, College of DuPage (see notes at the end of this article).

AUGUST

August 10 (Saturday) - Western Illinois ARC Swapfest, | Quincy, IL. Eagles Alps Grounds 3737 North 5 th Street. | 4.5 miles north of downtown Quincy with easy access from US | Highway 24. 8:00 a.m. to 2:00 p.m. Admission is $3.00 at | the gate, $2.50 in advance, per person. ARRL VEC testing, | all classes, is at 12:30 p.m. Reservations go to NA9Q at | (217)224-8526. Indoor flea market is $5.00 per 5-ft table. | Outdoor tailgating space is free. Talk-in is on 147.03. | Lunch will be served on the grounds.

August 18 (Sun) - DuPage ARC, Stickney, IL. DuPage ARC Hamfest Computer Show. Hawthorne Race Course, 3500 S. Cicero Ave. Air conditioned exhibit hall for dealers. Outdoor fleamarket spaces free. 8AM - 2PM. 6 AM setup. Admission $5. Kids under 12 free. Talk in 145.25 MHz. Info: Ed Weinstein, WD9AYR, 7511 Walnut Ave., Woodridge, IL 60517. tel: 708-985-9256.

August 25 (Sun), Woodstock, IL - Tri-County Radio Group. McHenry County Fairgrounds, Rt. 47. Admission $5 at gate, free parking. Kids under 12 free. Info (voice/fax) (708)658-1678.

August 25 (Sun) - Vermilion County ARA, Danville, IL. Info: Gary Denison, KA9SKS, 14704 East 2750 North Rd., Danville, IL 61834-5610. tel: 217-759-7389.

August 28 - 30 - Antique Radio Club of Illinois, Elgin, IL. RadioFest96. Holiday Inn Holidome and Convention Center, 345 River Road, Elgin, IL 60123 Ph. (708)695-5000, (847)695-5000 After 01/20/96. Info: Jeff Aulik, 1708 Parkview Ave., Rockford, IL 61107 or Carolyn Knipfel, RR 3, 200 Langhorn, Morton, IL 61550.

SEPTEMBER

September 8 (Sun) - Bolingbrook ARS, Joliet, IL. Info: Ed Weinstein, WD9AYR, 7511 Walnut Ave., Woodridge, IL 60517, tel: 708-759-7005

September 13-15 (Fri, Sat, Sun) - Peoria, IL. ARRL National Convention. Info: Ron Morgan, KB9NW, PO Box 3508, Peoria, IL 61612-3508, tel: 309-694-2649

Sep 21 & 22 (Sat & Sun), Grayslake, IL - Chicago FM Club Radio Expo. Lake County Fairgrounds. Starts 6 AM. Buildings open 8 AM. VEC testing. Info, (708)457-0966. Usually one of the best hamfests in NE IL.

Sep 29 (Sun) - Computer Central, College of DuPage (see notes at the end of this article).

NOTES - Computer Central shows

Computer Central computer shows are held at the College of DuPAGE, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 708-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm.

I agree with you, I'm tired of reading the get rich scams too. However
you do realize that what you are suggesting. You are suggesting some sort of
censorship. So who makes the decision whats allowed to be posted and what's
not? I'm quite sick of someone else making decisions for me. I don't think
this representative democracy where one person makes decisions for others
works. The Internet is not run by anyone. I'm glad that is the case. I'm
glad we still have *some* freedoms left in this world.

First, they start off with banning advertisments. Next they start
banning contraversial topics. Next thing you know, we can't talk about celluar
mods or monitoring federal frequencies.

If you don't like the message, hit your down arrow key. One button
one press. Don't read it. But please dont suggest limiting what little
freedom we have left.

Keith

Yea but for a few dollars more, you can get a very nice interface from
Optoelectronics, which controls more than just one scanner.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of |
the author. It is posted twice monthly on the USENET |
groups rec.radio.scanner, alt.radio.scanner, and |
rec.radio.info. It is also available electronically from |
the rec.radio.scanner ftp archive on the official USENET |
FAQ library ftp://rtfm.mit.edu/pub/usenet-by- |
group/rec.radio.scanner.]

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA. It
tells where you can buy your first scanner, what features
it should have, where to get it repaired if required, how
to get frequency information, and mentions a few scanner
clubs worth joining.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,
taxis, and buses are all equipped with radios and you can
listen to them. You can monitor the local sheriff and fire
departments to hear about events "as they happen," before
the news reporters hear about them. Hostage dramas, bank
robberies, car crashes, chemical spills, neighbor and
domestic disputes, tornado sightings are all fair game. In
a single afternoon, you can hear a high speed police chase,
Drug Enforcement agents on a sting operation, and
undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss
strategy with his advisor from a 415 MHz radiophone in Air

Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-62 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer to replace the stock antenna with an Icom FA-1433B dual band flex antenna which is thin and very flexible while providing better performance than a stock antenna.

Although it is small and somewhat tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Since 1988, I've used the "Thin-Stick" 18 inch telescoping antenna for extended range on my portable scanners and 2 meter walkie-talkies. The Thin-Stick, made in USA by Smiley Antenna Co., Inc., is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and

the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155. Web page is | http://www.grove.net

- National Electronics (formerly National Tower | Company), PO Box 15417, Shawnee Mission, KS 66215. | Telephone (800)762-5049, (913)888-8864. Web page is | http://www.sound.net/~ne/ |

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

If you cannot find files describing modifications to a particular scanner, it's probably because nobody bothered to devise a modification, or more likely, nobody has taken the time to document their modification.

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then

copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The 1996 editions contain selected business listings, too, although callsigns are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing),

and available from Grove Enterprises for about $30. A new, 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information

Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the

locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (708)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio

room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio

into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $27.00 per year, which includes the monthly Scanner Journal, approximately 50 pages in 8-1/2" x 11" format. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. The RCMA web page is at http://comp.uark.edu/~plaws/rcma/. The RCMA electronic mail address is RCMAHQ@GEnie.com.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

CARMA
P.O. Box 2681
Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

All meetings are held on Saturdays at locations announced in advance. Meetings are usually held at:

- the Destiny Restaurant, on Rand Road, in Des Plaines,

- Philly's in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook,

- The Great Escape, on Irving Park Road, Schiller Park

and at other restaurants.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of |
the author. It is posted twice monthly on the USENET |
groups rec.radio.scanner, alt.radio.scanner, and |
rec.radio.info. It is also available electronically from |
the rec.radio.scanner ftp archive on the official USENET |
FAQ library ftp://rtfm.mit.edu/pub/usenet-by- |
group/rec.radio.scanner.]

I am often asked, "How do you find these frequencies?"
Scanner enthusiasts can obtain frequency information from
several sources, including books, government microfiche
records, or other listeners.

Books

The most convenient source of fire and police frequencies
is the Police Call, published each year in 9 regional
volumes by Hollins Radio Data, and sold at Radio Shack and
larger book stores for under $13. Police Call is basically
a computer printout of FCC license information in the fire,
police, local government, and conservation services in two
lists: by licensee name within state, and by frequency.
Later editions have included a few pages of local airport
and nonsensitive federal government frequencies. The 1996
edition contains selected business frequencies, too, but
callsigns are listed only for local government and public
safety licensees.

I highly recommend Richard Barnett's 1992 book, Monitor
America, published by Scanner Master Corp. A 3rd edition
is expected soon and will be available from Grove
Enterprises for about $30. This second edition is crammed
full of police, fire, local government, news media, sports,
national park, and commercial broadcast frequencies for all
50 states. The information was compiled mainly from

members of the world's largest scanning club, the Radio Communications Monitoring Association (RCMA). Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring

Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. In the 1995 edition, fields are different than PerCon's Spectrum CDROM. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across

the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (708)554-3839 6-10 PM central time. For a brochure, send SASE.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 50 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA. The RCMA electronic mail address is RCMAHQ@GEnie.com.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for

frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using

call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

Yo everybody,

I have been picking up a non mobile phone conversation on a baby monitor frequency of 49.875Mhz. Is this normal? It isn't a regular cordless phone frequency.

Also between 1020 and 1030Mhz I can receive 4 - 6 mobile phone conversations. I live in the Fayetteville NC area. If these are not cellular. What might they be? Please enlighten me oh wizards of the electromagnetic spectrum.....

D. Haas

Technically speaking, VHF and UHF frequencies do not "skip" in the sense that lower frequiencies skip. What you are hearing as something called tropospheric ducting. Caused by air inversions and strong frontal systems. It is most common during the Summer months, but it can happen at any time of the year.

Lower frequencies "skip" or bounce off of the ionesphere. The study ionespheric interaction with radio waves could fill volumes.

Enjoy.

And...

Cellular was developed in the late '60s. The only reason that it took
until the early 80's to get it rolling was the cost and size of the
hardware. The equipment required in your car to make cellular work would
have filled the trunk. Probably would have effected your gas mileage ;)

Back then (60s and 70s) your scanner enthusiasts were all using expensive
crystal channeled scanners that were the size of a toaster oven and had
(maybe) a dozen channels. "Nobody" had 800 MHz syhtenzised capability
that they could haul around to steal ESNs. Even in the '80s, 800MHz
wasn't that widespread among hobbiests.

Cellular fraud is an example of what can happen when your
communications equipment techonology outruns your methods of
communicating. Analog AMPS cellular will not go away tomorrow. We have
to keep it around to support the millions of existing phones (there are
like 22,000,000 cell phones on line in the US). Security wasn't a big
concern 15 years ago. What is happening right now probably can't be
cured. We just put band-aids on it until we can phase in a new
technology...which of course will be hacked by some jr. high school kid
while it is still in it's beta testing phase ;).

I am a professional paramedic trying to located a professional
800mhz scanner that is now discontinued this scanner was produced by
Uniden A few years back. I know it was still available up until about
1994. Description Grey led and all controls located on the front a
scanner
that measured approx. 6" x 9" This scanner had an optional computer
interface for programing. It had both ac/dc capabilities. We had these
scanners mounted in our Fast response rescue units. This scanner was a
"professional" scanner per the paperwork supplied. If you Can provide
any
information It would be agreat help in possible finding this scanner on
the secondary market. Thanks, Rich wakeland@earthlink.net

When the conditions are right, I often hear the Mississippi Highway Patrol on the freqs I have programmed in for the Indiana State Police (42 MHz area). My monitoring post is about 500 miles due north of the communications I am monitoring.

Kind of neat the first few times, but now just a pain in the ass!

HP 8920 communications test set, unit was accurate and stable withing
10 Hertz from 60 to 512 Mhz, not bad for 99 bucks, It had some significat errors
around 900 and up, but not too bad say 1 or 2 Khertz. A good buy if you
do the hold switch mod. Not as stable as a Startek or Opto, nor as sensitive,
but we used it to align 9600 baud biz band data radios when the HP was out for service
to within 700 Hertz at 467.

Does anyone have advice on how to properly use the built in data slicer?
I have some programming experience, using com ports. I would like to
experiment with data reception using the Optolinx, What if any
initialization is required?

Thanks

Bob

David:
Actually, it is a regular cordless phone frequency.
It is the frequency for the handset for which 46.730
is the base frequency. You are almost always better
off listening to the base frequencies, because they
are true duplex (you hear both sides of the conver-
sation) and the signals are generally stronger.

>was looking at it.

There is no cut-off date. With newer ones, you just have to go into Test Mode 3 (hold down [2] [9] [Band] at the same time) which lights up all your LEDs from left to right to verify they are working.

From there, you can do a [2] [9] [Lockout] and just into Test Mode 1 (which fills the first 25 channels with preset frequencies, including one inside the illegal 800mhz cellular and a few in another blocked area -- simply scan up and down from inside the banned area and set your scan limits within). There is a FAQ around here somewhere that explains it all in detail.

Jeff,

I knew of the availability of the cellular band between 894 & 915.
What was of most interest to me, however was picking up the Police &
Fire frequencies between 806 MHz & 860 MHz, which you can get with the
preprogrammed services feature, but not directly. I did receive a
response on how to receive these bands as they appear in the 151 MHz -
160 MHz range. I will post or e-mail it to anyone who is interested.

Now, what are Nite Scan and what kind of earphone jack audio output
mods can you do? I'm a little new at this so I would love to be
enlightened in this area.

Thanks for your response, as I really appreciate the help. Thanks
again.

>Please e-mail me any information on this. It will be greatfully
>accepted.

It is indeed true that the Uniden BC220/230XLT can get these frequency ranges. Actually, the unit lets you search and manually enter frequencies between the frequency ranges of 860 MHz - 956 MHz. It has preprogrammed Police, Fire, Marine, Aircraft, and Weather bands which also include frequencies in the 806 MHz to 860 MHz range, but you cannot enter these frequencies directly, or save them to memory (not that I've found at least!)

Let me know if I can be of more help.

>
> D. Haas

Dave:

The cordless phones work on two different frequencies at the same time.
One is for the handset to talk to the base, and the other is the base to
talk back to the handset. The 49 MHz area if the handset. And yes, the
49 MHz area is also used for those baby monitors.

As for 1020 - 1030 MHz...you're most likely hearing what is called
images of the Cellular band. It's not "right on" frequency. It has to
do with the frequency of the IF's in your scanner, harmonics, etc.

Source record: 231582

I'm interested in listening to air to ground communications with relation to NOAA hurricane hunter aircraft or other NOAA storm tracking aircraft on either VHF or UHF (the latter most probably in in the MILAIR spectrum). I already know about the NOAA Weather radio service in the 162 MHz range and have all those frequencies. Does NOAA conduct two way (ground to air or air to ground) comms using VHF or UHF? I also undertsand that NOAA has digital weather equipment which may be operating in the VHF or UHF spectrum for the purpose of sending weather data (i.e. offshore buoys). Is there a list compiled for such frequencies? If so, please send me Net-Mail with an up to date listing. Happy Monitoring...Brian.

From: mikeg@panix.com
Message-ID: <31c4d54d.12306220@news.panix.com>
Source record: 231617

Has anyone managed to mod a Uniden SC150? My best guess is that it is most similiar to the RS PRO-46. It seems that ALL the features match exactly except that the keypad tests don't work the same. When entering the test mode 1 (2,9,L/O), it forces the display test. Using other combinations, I found that I can perform the PRO-46 TEST MODE 1 by using the the 2,9,SCAN key. However, the SC150 leaves out the following frequencies:
66.450
76.825
87.425
888.96

If anyone has any information on ANY mod available, please let me know.

Well I just read about the movie COPYCAT in Monitoring Times. They said that a Uniden Bearcat BC700 appears in the movie. Well, curious as I am, I went and rented it. Besides the BC700 appearing mid way in the movie. I spotted what looked to me like a Radio Shack PRO-2030 in the begining sitting on Weavers desk by her computer. I know you all probuly don't care, but if your like me, you enjoy seeing how scanners are treated on TV.
And another Movie with a scanner in it is Die Hard. Looked like a Bearcat type, but they didn't show a good shot of it.

SW>a suitable connector to plug into the AR8000's battery pack socket.

I hear nothing good about the "official" AOR interface. The cable tends
to short out and yes it is not polarized.

The AR8232 is a Maxim 232 and a logic data mux. The box looks well
built but the cables are same as it ever was.

Opto modifies the scanner with a cheap 1/8 stereo mini-jack which I
assume is TX, RX, and ground. Someone has managed to insert in RJ-11
phone jack, which I think is quite a feat. I'm leaning towards using
a 7-pin mini-din, but can't find any panel mount mini-dins locally.

Thanks for all replies.
The experimental unit I have designed works very well. Although the cell data is far above audio, and you do mention the 20khz-wide IF, the 2006 has a 'WIDE-FM' mode, with a seperate demodulator chip to cope with this. The cell data is perfect at this point.
Without giving too much away, the 4046 is impossible to get to lock on the signal, as the signal uses two different frequencies at 'random'. I did originally try a 4046 (for DAYS!) and gave it up as a bad joke.
The UMF1000t chip is a good thing, but unnesassary when using a PC, as all the smart stuff is done by the PC anyway.

Thanks again for the reply, however it is looking to be a little too risky, although it would have been cheap and easy. (and fun)

TD.

Thanks for the reply Greg. If the 2042 has the cell band already, then it wouldn't be too much drama to change my software to address the 2042's PLL instead of the 2006, however I don't have a manual for the 2042, but if I go ahead, I will write code to address a range of scanners.

Thanks Gene. The cellular comms data is a very simple job for todays PC's to decode real-time, the trick is making the hardware interface easily and cheaply, and writing the code to suit.

Thanks again.

TD.

HI Steve!

Looks like you have been checking out the interfaces. I have the CAT 232, AR8000INF and just recently
purchased the OPTOLINX. I haven't had time to test out the Optolynx as yet, but have info to answer most of
your questions:
First, a replacement cover did not come with any of the interfaces. I believe OPTO has the Scout interface
SAC8000 for $35 that includes a cover and a FFC cable interface for the AR8000.
Second, the CAT-232 Works very well with Scancat Gold AND Scanstar AND RCSI Scannerwear 2.0. It does not have
a squelch return to the radio. In order to try out Radio Manager for Windows, it was necessary to obtain the
AR8000INF. The unit will not stop on any frequency without the hardware squelch return (Radio Manager).

Now, lets get real! The FFC cable is terrible. I have modded my AR8000 to accept the stereo cable from the
CAT-232 so that computer control can be achieved without that nasty cable. I purchased an FT-50R HT from
Yaesu, and found their mic connector to be FOUR conductors in the form of a mini stereo jack! It would be
fantastic to get a four conductor plug combo for the CAT232 and mod my AR8000 to include squelch return! That
would be the best of all worlds!!

I will ask Jim Springer (ScanCat) if that is possible. More on this later!

Yeah, I've done it. It was pretty simple and it provides only a slight noticeable difference, but still a difference it does make. IMHO, any improvement, even slight, is better than none.

I'd like to know what is available on the market if it has to do with two way radios, scanners, communications devies etc. Maybe the add should not be posted in full but a link to a web page would be a better idea.

I've read some great arguments but I'm still not convinced. I also agree that this has turned from a discussion on what belongs on the newsgroup to just about what I eat for dinner.

I've expressed my opinion and so have others. Thats it for me!

Now back to scanning.......

Doing yourself a little bit there. Current rates are about 1GBP = $1.5/$1.55
so at the moment 25.00 x 1.55 = $38.75 plus postage.

If you do get any enquiries from the US just take US Postal Orders - pay them
into your bank like any other cheque but you will need to take account that
it might perhaps cost about 10.00 Pounds to handle the cheque and converting
into Sterling !

The Condor works very well on handhelds. Two disadvantages: the antenna is about a foot long, and it is fairly wide at the bottom, which makes it impossible to hook up an earphone/external speaker to the scanner. However, if these things are not a problem, the antenna will greatly improve reception.

The Condor sells for $29.95.

> them.

The Olympic Torch Relay will use some frequencies in the 464-468 band. Also try monitoring 167.5625, the nationwide FBI channel--communications reported to be in the clear! There are several posts about the Torch Relay in rec.radio.scanner.

As for the actual frequencies used at The Games, Motorola has installed a huge, complex communications network. The Popular Communications article said officials would use about 10,000 walkie-talkies, 1,500 pagers, and 1,500 cellular phones (the numbers may be slightly off). The walkie-talkies are reported to be set to 900 MHz trunked frequencies--the system is completely digital. This means communications will be unintelligible to scanners.

But all is not lost. In the Atlanta area, listen to Atlanta Police, Fire, EMS, and city services. Also check out the mass transit frequencies, which should be extremely active.

In the Washington, D.C. area, where the soccer matches will take place, check out the same agencies.

David

There is a difference between copyright infringement and free public data. Copyright infringement would be if you photocopied the page of their book, with their layout etc. Frequencies, along with telephon numbers, addresses, and a lot of other stuff in public knowledge. Hence, it is available to everyone. True, most frequency guides and some dictionaries use "decoy" information, so they can trace who got what info where, but most of the time you can avoid any problems by putting a note on you page saying "Some of this data was obtained from Radio Shack's Police Call directory." As long as you don't post the whole book, they shouldn't have a problem with it. Most magazines are the same way, you can use quotes (frequencies) as long as you don't use the whole thing and annotate where you got them. Of course, if you actually hear a frequency on your scanner, you don't have to quote anything, since you could have been scanning that freq range and heard it.

I have uploaded to Simtel.Net:

http://www.simtel.net/pub/simtelnet/msdos/hamradio/yascan17.zip
ftp://ftp.simtel.net/pub/simtelnet/msdos/hamradio/yascan17.zip 63155 bytes

yascan17.zip The Yaesu FT736r becomes a recording scanner

YAscan ver. 1.7 is a DOS program that works with the CAT (Computer-Aided Transceiver) function of the popular Yaesu FT736r VHF/UHF radio to turn it into a recording scanner. The FT736r CAT port connects to your computer's serial port via a voltage conversion interface such as the FIF-232c. A 3-wire home-brew interface should also work. YAscan can be set to scan a range of frequencies (e.g. 144.665 to 146.000 at 5KHz steps) or a specific set of frequencies (e.g. 144.665, 146.880, 431.000...). Scanning can take place in the NFM, FM, LSB, and USB modes. Frequencies heard are displayed on the computer screen indicating frequency, number of times heard, S-meter range, and first and most recent time heard. This information can be printed or saved to disk for later viewing, or for importing to a data base or loading into YAscan and other programs. The program is simple to use and has complete documentation built-in.

Special requirements: Yaesu FT736r Transceiver, and serial port to CAT interface.

Changes: Compared to ver. 1.4, the program now works with the FT736R transceiver 1.2Ghz module, several problems have been resolved, the number of scan passes' is recorded on printed output and saved files. (The file 'read7.me', accompanying YAscan17, contains the change history.)

yascan17.zip has replaced yascan14.zip.

Freeware for non-commercial use. Uploaded by the author.

Hi Bob

I have an INMARSAT antenna that I have imported from England, and it works well on INMARSAT. I get around a 9+ to 10+ signal on an ICOM R7000 receiver. I have also tried a 20db amp and the signal to noise ratio is still really good.

I have heard quite alot od DATA and VOICE, and the search continues, send me an email if you want more information

It's definately limited to 250 total channels with an alpha description but as you have discovered there is no restriction on the channel numbers assigned to the alpha descriptions. It is due to the size of the 8K x 8 EEprom and the way the software uses it. The radio uses 1 byte per channel to store the attributes, LO, Dly, Attn, etc, and 4 bytes per channel to store the frequency and modulation. These 5 bytes x 500 take up 2500 bytes. The alpha characters are stored as plain ascii at 16 bytes per channel and then there is 2 more bytes per each alpha description slot that contain the channel number that cooresponds to the description. This is 18 x 250 for another 4500 bytes. The remaining 1000 bytes is used for misc items like begin and end search frequencys, priority channels, lanquage, modes, etc.

Test mode 3? I didn't realize there were more than just one or two test
modes. Does anybody here have a list of the various test modes and what they
do etc., etc?

I've had good luck with mine.
Restoring cell freqs is as easy as clipping one diode.

That's ok Aaron,

If you want to control more than one radio, then spend a few more
dollars, It is a very nice, high quality unit.

BUT - If you only want to control one radio at a time, then I have a
low cost solution:-

In fact, since I made that posting I have had several enquiries for my
DIY and built up AR8000/7200 unit - I have now got the proper rates of
exchange and postal prices by air to USA.

My DIY kitset interface is USD50.00 and ready built at USD75.00 -
these prices include delivery to anywhere in Canada/USA

(BTW: without the special Flat ribbon cable, my interface is a
standard RS232 that will interface ANY radio or other equipment that
has a RS232 port at TTL (5V logic) levels)

Email me if interested to find out more...

D.Gray@AutoComm.CityScape.Co.UK

Regards and happy scanning...

Does anyone know of a good SCA decoder board, or kit, that I can add to my FM radio?
I had considered a Ramsey kit, but just last week I heard that it doesn't pick up one of the two sub-channels very well. I know I have seen other adds for them, but of course, now that I'm really interested in them I can't find one.
If you know of a good book or article about them, I'd appreciate hearing about it.
Thanks in advance,
H Higgins

Unfortunatly this probably will not happen.
It has been known for a long time that for a service provider to supply cellular service to a specific area costs them FAR less than providing the same area with land-line. The problem is that any cellular service couldn't cope with such volumes of traffic, so the service providers use pricing to set the use of the service just below system capacity.

Unless the system capacity is increased by 5-10 times, you will always see cellphone system providers riding the prices around to adjust for MAX-load, and thereby getting the maximum amount of dollars they can from the limited system thay have.
The last thing they need is more system clutter without getting any extra monthly-access fees.

TD.

No one likes those inane advertisements, especially when they show up in
one's e-mail (along with newsgroups). However, I don't think we should be
so complacent and sit back and just say "hit the down arrow key."
Newsgroups have basic (unwritten, I admit) rules and one of them is that
off topic messages should not be posted there. People who post their
inappropriate messages are not exercising their right of free
speech--instead they are infringing on our right of free speech, assembly,
whatever other constitutional rights prevail in this case. Free speech
does not extend to a guy yelling "Fire!" in a crowded theater; and free
speech does not extend to a guy blasting unwanted messages without regard
for the basic rights of others to go about their business (in this case,
discussing scanner stuff).

Unfortunately, there isn't much that can be done about it, beyond sending
the offender a nasty note (and most use sham addresses to avoid it).
They're like the street punk who gets on a crowded city bus with his
suitcase-sized boom box blasting out some song about killing cops or
shacking up with your sister; you'd like to tell him to turn it off so you

can get some sleep but you know that the minute you do, he's going to get in your face. Unfortunately that scum sucker is now sending out junk e-mail!!

I do agree with you that some off topic posts would certainly create a lot
of chaos and would infringe on our rights. The problem I have is that there

is little that one can do about it. Too often a companies solution is more to our detriment than to our benefit. Their solution is censorship. I would certainly never belong to such organizations like Compuserve or AOL which limit expression. It is funny how our first amendment rights are forgotten whenever we go online.

: I don't think you can call overseas with a pile of "quarters" deposited
: with your hacked Radio Shack tone dialer. Live operators normally come on
: for intl. calls, don't they? They know how tell red box tones from real
: money being put in the phone.

Well, actually, you can. International calls still use the Automated Coin Telephone Service. And even if a live operator were to come on the line, correctly calibrated red box tones would appear identical to the tones generated by the 'actual red box' inside the phone. I would not include a Radio Shack tone dialer in a definition of a correctly calibrated red box . The operators can tell the difference between a RS tone dialer and normal money because the tones played by the RS device are slower, but still within specs for ACTS.

Incidentally, the phone phreaks of the 90's still use a box that generates a few simple tones to call free anywhere in the world.

If I remember correctly, the manual states never to connect directly to
the 'mains'. In other words do not hook 120V directly to the radio (duh).

>D. Haas

The first is a cordless phone. This is one of the new channels added
when the FCC allocated 15 more channels. The 25 channel phones have
provisions built in to detect when a baby monitor is in use on the
same channel so that the phone will pick an unused channel to
eleminate interference.

The conversations you hear around 1020 are more than likely images and
are probably cellular in nature.

>: 45 chars etc etc

>How's that again? Last time I looked the AR8000 had 1000 user-definable
>frequencies and alpha tags were 7 characters long.

It does!

It is the "Channel Commander" V2.0 software that _augments_ the AR8000 features. The programme does not replicate or mimic the AR8000 (What is the point of doing that? You have got that without the computer!)

What the programme does is to provide up to 250 on screen channel buttons that are in User Definable "Categories" and "Groups"

Catagories such as "Police" or "Military Air" or "Mobile Phones" etc etc and the groups could "Downtown" "Uptown" or whatever you decide to define it as.

The captions or legends on the buttons ae also user defiable with alpha tagging on them upto 25 characters long (Meaningfull descriptions)

Each button is totally user definable with freq, step, mode, attenuator on/off, etc. Each button has a comments field some 45 characters long.

You can think of it as having 4 alpha taggs per channel/button. Category tag, Group Tag, Button tag & comments field - Combined together gives a tagging potential of 100 odd characters for each frequency - sure beats the heck outa the 7 characters on the AR8000 screen

The programme is designed to give very rapid channel hopping back and forth to predefined frequencies. I many respects, instead of 2 VFO it is a 250 VFO! but all alpha tagged!

Although it may appear odd that only 250 channels are catered for but dont forget, they are available on screen at the click of the mouse! on screen. In reality, 250 is usually more than enough, however if you need more than 250, a second bank of 250 can be invoked.

It also allows for direct entry of a frequency, overriding any buttons. It also has Date/Time stamping on frequency logging for recall later.

The programme will also allow the radio memory to be read and written to and all that sort on management tools are included. This means that you can programme or modify the contents of the radios memory.

The AR8000 here in England are full range, I am not sure of the methods of how to open up a USA version, I know it is s/w driven. Once I find out, there is no reason why that routine cannot be added to the programme!

It is written in Visual Basic Professional, so it has some nice styling!

Regards and happy scanning...

Your dead right chum, but when you suffer from dislexia & word
blindness, even that word that is a single letter and comes before "B"
in the alphabet can cause a bundle of trouble. Not many people can
spell it wrong! It takes quite a bit of effort not to get it right!

When it comes to words with a pf or a fp or hp or ph (made it) like
fone, or foto I get kinda phreaked out and confused.

I don't know what the heck this has got to do with scanners - it's way
off subject, but a Yank telling a Limey how to spell!

You can't spell colour right. As for "Programme", well forget it!

Who ever thought of spelling "pavement" as "sidewalk" - It doesn't
even sound the same. You miss-spell "lift" as "elevator" miss-use the
word rubber (a small block of rubber that is used to rub out a pencil
mark on paper) - You try using an English rubber as a contraceptive,
it just won't stay on! And its too thick.

You spell "timber" with a "L" and can't get "Theatre" right.

You pay your checks with a bill, when you should pay your bill with a
cheque.

That Boston tea party you had a while ago - any one with any sense
knows you need HOT water to make tea. And Boston "harbour" water was
not the tastiest in the world!

Well "neighbour", I have "laboured" long enough - 'tiz time to bid
thee well and take my leave.

>
> Does anyone know how to program 2 phones to the same number?
> Any help would be greatly appreciated.

Programming a second cellular phone with the same number as the first
will not make it operational. In addidion to the cellular number, each
phone also transmits a unique electronic serial number (ESN). The ESN
is built into the phone at the factory and is not normally alterable by
the user or the dealer.
If you try to use a phone with a valid cellular number, but a
nonmatching ESN, the system will refuse the call and may even
temporarily invalidate your account as part of an anti-fraud program.

Nothing besides the fact that there are three antennas mounted next to
each other and a shack at the bottom out in the middle of nowhere. Two
were probably recieve and one for transmit. The ones I saw were vertical
dipoles on top of a 80' wood pole (I think it was the tallest wood pole
I've seen too).

>adjustments.

Absolutely. A simple low cost Yagi directional antenna for 50 MHz is described in the ARRL Antenna Book at 18-22. It has three elements appx. 9 1/2 feet long mounted on an 8 foot boom. Picking the midpoint of your freq. range (44.5 MHz) and applying the appropriate formulas reveals a 3 element beam with elements from about 10 1/4 feet to 11 1/4 feet long.

You may be able to find a copy of the handbook at your local library or at a local amateur radio store. Or, if you want to buy the book visit http://www.arrl.org/.

> radio operators call it a PIA!

The causes of sporadic-E are still subject to debate, but there is a difference between skip caused by ionization of the atmosphere and that caused by weather conditions. Confusion arises because the atmosphere itself plays a role in both types of skip.

The skip that develops due to stable high pressure is a form of tropospheric ducting, often referred to as "inversion" by hams and meteorologists. Ionization is not involved. The signal is carried in an atmospheric waveguide formed between layers of air that have differing characteristics of temperature and relative humidity. This type of propagation is common in coastal and Great Lakes areas.

In fact, I heard Canadian traffic from across Lake Ontario this past Sunday evening while carrying my portable scanner up my driveway! Normally, reception requires good conditions, low ambient RF, and the use of my rooftop antenna.

What an IDIOTIC way of thinking!! Hey I know,,,they charge too much for meat so let's pay for one steak and steal the other! The majority of "cloners", (airtime thieves), are NOT people who are trying to make a statement by not paying for their SECOND phone, it's the little weasels trying to make a quick and dishonest buck that are the cloners. Their party is just about over IS-136,,,authentication,,,etc...

: as to all be the same, and the loss was $2.5 million?!? At $10.00 per month,
: he would have had to change 250,000 pagers!

It was cellphones, not pagers, being cloned. The "lifetime" cellphone
contains the ESN/MIN's of 100 legitimate subscribers in the phone, and the
user could select anyone he chose to bill his calls to. When each
account got cut off after a month (when the real user found out what was
going on), the user would change over to start using another account from
the memory in the phone.

These are "images" of cellular phone calls. The true frequency is
between 870 and 894Mhz, which your radio probably won't tune to. But most
radios receive these (and other) frequencies, not as clearly, at some
other place on the "dial". Exactly where you find the images varies
depending on how the radio is designed and what intermediate frequencies
are used.

:

The reason they have the warning in there the manual about not hooking
the radio to the "mains" supply is just that, you shouldn't DIRECTLY hook
the radio to 120V or 240 or whatever. That means, you should always use
some type of adapter. Kind of obvious for those who can figure out how
to work the AR8000, but I have heard stories about Radio Shack
salespeople making adapter cords like this. I've heard about an RS
person suggesting to someone to just get an AC line cord and solder it
to one of those small round connectors.

I have had one for about 9 months now. Great little scanner. for the
casual user. Best part...since it is not the top of the line scanner,
it does not have all the top notch filtering. As a side benefit, you
can pick up "cellular images" in the 800 to 956 mhz range. These
"images" are identical to the actual cellular freq's. In other words,
you can easily hear cellular conversations!

1152. AR8000 and power supply?

Newsgroup: rec.radio.scanner
Date: 1996-06-18 00:00:00 UTC
From: Philip Dearmore <morbeus@eskimo.com>
Message-ID: <31C60782.597D@eskimo.com>

Cross-posted to: rec.radio.scanner,alt.radio.scanner

Greetings all, from a happy new AR8000 owner!

I was just reading over the instructions, and I'm not an electronics whiz, so I was hoping you could clear something up for me. The AR is supplied with an external power jack and wall adapter, and I assume the wall adapter is for AC current, however the instructions seem to indicate never to connect the AR to an AC power source! Is this some kind of Country specific thing where us people in America lose out? I would like to be able to power my AR at work for 10 hours a day with a standard wall electrical socket (the standard, I THINK is 120V AC). So explain to me, if you would, if this is possible, or if we in the US just can't connect the AR to a wall socket. If I can buy a converter, what model, exactly, would I need? Your expedient reply is most appreciated! The more replies the merrier, and via e-mail more so. Thank you!

Hi folks!

I just bought a used scanner from Uniden: BC-70xlt. Obviously, this scanner can't do 800Mhz, but is there any mod that exist for this model?

Maybe there is other interresting things to know... ?

If anyone can help, please let me know.

J.-S.

N.B.: Please E-Mail me since I don't read this group on a regular basis.

Hi all, another question.

The AR8000 supports 1000 channel memory, right? But does that mean 1000 channels for each scan and search, or do they both use the same thousand? That is, if I use bank A with an upper and lower search limit, then can I or can I not use it as a SCAN bank with different channels in it? Also, how do I get AM stations on the AR? So far I've only been able to listen to FM. For example, say I wanted to listen to 570 on the AM dial, how would I put that into VFO A? Thanks!

Hi Philip...
I believe the reason AOR says not to plug into 120v for extended periods
of time is because the power cube is charging the batteries in the scanner
at all times...Overcharging the nicads can cause problems...I have removed
the nicads from my 8000, and ran the power cube from 120 volts since the
day I received it...No problems have occured so far...good luck...

That is the handset frequency for the U.S. cordless Ch 20, which is the same
as the baby monitor "D" channel. The paired cordless base freq. is 46.73 MHz.

In German, the word means "jewelry".

In Yiddish, it means "penis" (akin to the English-language expression "the family jewels"). By extension, someone of whom you disapprove is referred to as a shmuck. (The word can be spelled with or without the "c" if used in the Yiddish sense, depending on whose system of trans-literation you use. Leo Rosten advocated dropping redundant C's from Yiddish words to avoid the possibility of its being pronounced as if spelled "skmuck" (like "school", which in Yiddish is pronounced [and spelled] shul...))

Yeah, I remember back in the early 80's, a cellphone, the kind you'd put
in your car, cost around $3000. They didn't give those away back then.

I have the Spring 1995 CD. It will not print the frequency when you do a print out in DOS mode. I sent mail to the company president about the problem and he basically told me to do it from Windows. Anyone with ANY experience with computers knows a DOS dump to the printer is FASTER than bitmap printing from windows. He completely side stepped the problem and just basically gave no help.

>Thanks

The trunked frequencies are:

938.3875, 938.400, 938.4125, 938.425, 938.4375, 938.450, 938.4625,
938.475, 938.4875, 938.500

The older (read rarely used) frequencies are:

Brown Maintanence 464.5375
Green Op/Railroad 464.4875
Orange Maintanence 464.4125
Purple Buses 464.575
Silver Concessions 464.0375
Red Op/Rides 464.6375
White Trains 464.7625 monorails
Yellow Special Events 464.5125
Slate Indy 464.4625 parade control
SP1 Ride Security 154.570
SP2 Submarines 154.600
Paging 154.625 an especially annoying freq
Ham 146.940
Hotel Security 151.745

Note that these designations don't really mean much anymore. Most of
the traffic is on the trunked system.

Yes I have the DS8000 descrambling chip. It works on "Donald Duck" type of speech inversion, which almost sounds like single side band. It does degrade the sound quality of the radio, scrambled or not- because the audio must go through the chip and has apparently a narrow band width audio filter. I've gotten used to the degrade in audio. Something to consider though. It was real easy to install and is very easy to use. Just hit the LOCAL key. I hope that helps!

>What an IDIOTIC way of thinking!! Hey I know,,,they charge too much for
>meat so let's pay for one steak and steal the other!

Um, excuse me, but I'm not talking about "stealing", I'm talking
about simply being able to ALTERNATE PHONES ON YOUR ACCOUNT.

Look at it this way: do you pay $30 a month to the phone company
for each telephone that you have in your house? No. You pay $30
(or thereabouts) for each LINE. You can hook up as many telephones
as you want to a single line, and it's not stealing, because you
can't make more than one call on one line at the same time anyway.

Clear enough now?

>The majority of
>"cloners", (airtime thieves), are NOT people who are trying to make a
>statement by not paying for their SECOND phone, it's the little weasels
>trying to make a quick and dishonest buck that are the cloners.

Do you have a statistic on this? I would bet that the majority of
cloners are people like my dad. He has a bag phone right now that
he uses for road trips (because it has a lot more power), but he
would like to get a handheld model to carry with him in town. But
he can't, because he'd have to have a whole new account for that
new phone, even though he'd never use them both at the same time.

(NOTE: I am *not* saying that my dad has gone and cloned himself a
cell phone. I'm just saying that I suspect that's the reason many
people do it.)

Of course stealing someone else's frequencies and ID numbers and
using them for illicit purposes are illegal and immoral. But
that's the usage of the technology, not the technology itself.

Source record: 231428

> I am considering adding a Scout to my AOR AR8000 but still have some questions.

I'll save you some time: get it.

But if that's not enough :) I've been using the Scout/AR8000 setup for several months now and I will try to answer the questions I am familiar with.

The Opto Scout manual warns that although the AR uses Flat Flexible Cable for the serial data interface, it is "difficult to work with... in a portable application." It says the best solution is to add a >2.5mm< phone jack, which is what mine has. The manual has complete instructions on how to add the jack. In fact, the manual is very well written (in stark contrast to the AR 8000's). However, all this was before EEB started selling the SAC8000, however, which is a snap-in battery cover mount for the flat cable, which apparently has replaced the 2.5mm jack mod.

As for what it comes with, the Scout comes with nothing. Not even an antenna. Well, it came with some frequency database software, but that's it.

Computer cables are extra.

It does seem to work better with specific antennas at farther distances; close up, however, there seems to be little difference, and full schematics were not supplied with my unit.

Highly recommend this addition to the AR8000. In fact I use it for nothing else but Reaction Tune configuration as I have several other radios that are dedicated monitors. It's the best thing I've bought in years.

1194. UBC 3000XLT Scanner

Newsgroup: rec.radio.scanner

Avoid the NoTenna...it's basically worthless as far as I can tell.
Certainly did not do a thing for my reception.

If you're looking for indoor, just get a telescoping whip from Radio
Shack...you can get this on a suction cup mount and stick it on the inside
of a window and get decent reception I've found.

Don't know about the other models.

: > search limit, then can I or can I not use it as a SCAN bank with
: > different channels in it?

The search and scan banks are completely separate. Each of 20 scan banks contains 50 channels. Each of the 20 search banks contains an upper and lower limit, plus 50 individual frequencies which will be "passed" or ignored.

: > AR? So far I've only been able to listen to FM. For example, say
: > I wanted to listen to 570 on the AM dial, how would I put that

>Isn't the Scout itself cellular-blocked?

>No it isn't, There's no reason to block the cell phones as the scout doesn't have a speaker<

Technically, I don't think that's correct. Sure, the Scout itself isn't blocked; it's not a scanner -- it's a frequency recorder and has no audio. But, unless I'm mistaken, the law doesn't prohibit one from *hearing* cellular phones; rather, it prohibits one from *receiving* (as in with a radio frequency device) cellular.

If you had a scanner picking up a cell phone conversation with the speaker turned all the way off, for example, you'd still technically be a criminal in eyes of that ridiculous cell law. The fact that the Scout doesn't have a speaker, then, would have no bearing on its being able to operate in the cell bands one way or the other. How it does indeed do so legally is, though, beyond me, because, well, it's late and I gotta get some sleep. :)

just like to know the way to reset the memmory on the pro 43 scanner
its alittle different than my other scanners just bought it for a good
price
with no manuel... thanks..

1210. CB to Payphone..can't explain it!

Newsgroup: rec.radio.scanner
Date: 1996-06-19 00:00:00 UTC
From: boliphan@silver.ucs.indiana.edu
Message-ID: <4q9uf3$4to@usenet.ucs.indiana.edu>
Source record: 231445

Last night a friend called me from a payphone near a 4-way stop.
anyway we were talking fine then for about 1.5 seconds a CB radio was
heard on our phones. Right when it happened my friend said a large truck
meaning a semi went by. Apparently the trucks radio was bleeding into our
conversation...how?
I have never even heard of anything like it, and I don't know if
I would believe it if someone tried to tell me this, but I swear it
happened so if anyone could offer an explanation it would be great.

Right, then go to either

1) www.crl.com/~vhealey/ OR
2) www.crl.com/~vhealey/ar8000/ (can't remember which)

On one of these, it has a list of every Web page he has. Just click on it, and you'll get the right page. The links on the main page don't work. BTW, you'll find a load more interesting stuff this way.

Seeya!

Hmmm.... when you're there you might just run into me. I'm always carrying a radio and a scout while I'm there.

The Montclair Plaza uses CH-1 464.95 (security) CH-2 464.725 Tac2 (Also maintenance) 464.55 Vallet Parking (I think this is CH-3 I need to ask someone again if I can see the radio)

I found 154.6 when JCPenny was there (now Macys) I saw the person over by (now) Macy on the east side telling someone to open the metal doors. Haven't heard anything on it since. Not to mention I haven't been keeping track of it.

Two tone sequencial paging is used to set off pagers for various
Fire/EMS services. You will not gain anything by decoding these
tones. They are tones and nothing else. You can figure out the
frequency (in Hz) of each tone, but why?

I do not believe any decoder board will decode two-tone sequencial
tones. They are just tones!

However, there are some kits available to control something when the
correct two tones are received.

So again why would you want to "decode" these? Maybe I'm missing
something.

I don't have an explanation but I have something similar to add to this. Several
years ago my wife got mad at me and threw one of our speakerphones in my
general direction (this is the only time she's ever done anything like
this, and I was being a horse's hind end). Well, now when the phone's
speaker is ever turned
on it blares out a radio station. I'm not sure what station it is because
I haven't ever listend to it long enough to find that out. Needless to
say this has been a joke in our family ever since.

Hey man, hate to break the news to ya, but a long time ago the FCC added 15 new channel pairs for cordless telephone use. There are no longer 10 channels, but rather 25.

And 49.875 is no longer channel 5, but rather channel 20.

Now, since you probably enjoy listening to people's conversations, you can add 15 more channels of activity to your scanner.

He was probably using an illegal linear amp. I was once in a donut shop
that had it's flourescent light modulate when a CBer keyed-up in the
parking lot.

There are two commonly used sub carriers used for SCA. Several
companies sell kits besides ramsey that work much better.

Far better is one you build yourself!

Actually, Yes I can.

Law enforcement agencies have spent millions of dollars on radio
systems used to protect the public.

A criminal spends a hundred dollars for a scanner and goes around
breaking into buildings and committing other crimes and when he hears
the police dispatched he usually get away in time.

So the police scramble the communications to keep the bad guys from
listening. The problem comes when the good guys want to listen.

The price we pay for safety.

And to the point that enough RF energy leaked into the telco lines and was demodulated by the telephones.

Happens to commercial repeaters sometimes too if they are on the same tower as a tv or radio station.

I'll second that. Avoid the hidden tenna. Makes no difference if its hooked up to the car frame (like they tell you to do) or you just let it lay flat. It works just like a 3 foot piece of wire, just laying there doing nothing. Just my opinion and experience.

Hi,
A friend of mine did the same thing.....He got a container of
alcohol, not the rubbing kind, and dumped the pager in it....the
alcohol displaces the water, then evaporates, and all is well.

You could call your pager co. and verify this procedure....but it
works.

Oddly enough, that spelling of program is a recent French import.
(i.e. within the last 100 years.) The OED gives the nod to program
as the longer used English spelling.

Excuse me for adding my two bits, but it is possible to initiate two separate calls simultaneously using a cloned phone. This is how the cloners were making their money. Most cellular networks have already devised ways of preventing this problem from occurring in their local network, but there's still no clear standard yet to prevent the cloned phone from being used in an outside network.

As for having a second phone attached to the same cell number, some networks already provide this service. However, the user is still limited to having only one phone operational at any time due to obvious bandwidth concerns.

From the Pro-43 manual:

Resetting the Scanner

To reset the scanner, hold down both CLEAR and 0, and turn on the power.
This clears all programmed channels from the scanner.

I hope this helps you out. Let me know if you need anything else.

I have a group of Standard Drop in desk top rapid chargers.
Most are new in box, some appear to be new but no boxes. These
are used with the Standard commercial radios and with some of
their amateur products. Model # CSA-15

Price is $35 each or 3 for $100. If you buy 3, will ship
prepaid UPS.

1241. AR8000/PSU-101 Power Supply

Newsgroup: rec.radio.scanner
Date: 1996-06-20 00:00:00 UTC
From: Craig Ayres-Sevier <casevier@ka7syc.reno.nv.us>
Message-ID: <01bb5f2b.7459df60$efa25ecc@ka7syc.reno.nv.us>
Source record: 231370

I'm confused. The English Solid State Electronics Jim PSU-101 is advertised at 60 bucks as a power supply/stand for the AR8000, which powers the radio when the radio is switched on or charges its batteries when the radio is switched off. I assumed it was a quick charger, but, no. It's just a power supply/stand. No quick charge. No automatic termination upon complete recharge. So, excepting the construction of a supporting stand, doesn't the little charger, Model AA8000UL, that comes included with the purchase of an AR8000, essentially function the same way? It, too, is labeled as a "power supply."

I ask this because it used to be these little chargers could indeed >only< charge, yet when they first appeared about 20 years ago, they, too, were generically labeled "power supply." Nonetheless one was never to use these "power supplies" for anything but supplying power for recharging the batteries of a turned off radio unless you wanted to risk damaging something. That was then, this is now, some things change and some things don't, so I guess my real question is, if I don't really need a stand, but just want to use house power when the unit's inside, I don't need to scrape up another $60 to get the PSU-101; the included AA8000UL would be indentical for the purposes of both charging the batteries and powering the thing off the wall. Yes? Or no? Excuse the paranoia; I just don't want to fry my new AR8000. Thanks, folks, for your kind indulgence.

> AR? So far I've only been able to listen to FM. For example, say
> I wanted to listen to 570 on the AM dial, how would I put that
> into VFO A? Thanks!
>

Here's how the 8000's scan banks and search banks are broken up.
There are 20 search banks (a-j and A-J) with one upper and lower limit for each search bank.
Now there are 20 scan banks a-j and A-J with each bank having 50 channels.

So yes, you can have bank A have a scan program and a search limit.
As for AM stations.. you need to enter them in MHZ. So for 640 AM you need to press the decimal key, the 640 then enter.

BTW.. all of this information is in the user's manual.

Happy scanning,

Steve

DA>Catalog available soon, Use pager number for better results contacting (or
DA>e-mail your questions to danderso@nyx.net).

If you are referring to the DS8000, it will "descramble" frequency inverters
very nicely. This is probably what is used on cheap phones, but I haven't
tried to decode them. I use it on the rare occasions when law enforcement
use cheap frequency inverters.

One problem with the system it that the PL tone the law enforcement uses
gets mixed to a very audible tone after the DS8000.

In case you don't know what frequency inversion is, they simply take the
audio band and reverse the spectrum. That is, low frequency is now high
frequency and vice versa. It is done with filters and mixers. The DS8000
give you 4 possible mixing frequencies. Even if you are off a bit in
frequency, the message gets through. It is like tuning a sideband radio.

Goto your local DOC (ISC) office. They will give you the information
concerning what will be on the test and what to study.
Don't go and get the question bank and study that. But do get the
ARRL handbook. As this is where the questions are referenced from.
Study and know the subjects,BE A HAM. If you study just enough to get
the license then you will be no more then a CBer with a ham ticket.

Do you Americans know that you can get full cell coverage scanners from Canada. Last week I went to my local store (Durham Radio) and they have all kinds of goodies.

They still have the Radio Shack PRO-43's, as well as current models of AOR and Yupiteru (I think that's the way they spell it). All with full cell coverage. The salesman said that they sell into the USA all the time.

They've got a cool looking web site too. Their scanner page is http://www.durhamradio.ca/scanners.htm

I found them when looking for Ramsey kits. I run a pirate radio page and have a lot of people asking about the Ramsey transmitters.

If you are interested in pirate radio please visit my page at http://206.130.20.1:80/~glen/

I have a Maxon CP-0520-HD radio for sale.

- 4 channels (crystaled on channel 1 for 463.6500/468.6500)
- 5 watts
- Programmable CTCSS
- Heavy duty radio, built like a brick
- Flex antenna, wall charger, belt clip
- Jack for speaker/mic
- Needs new battery (common "BP-4" battery pack)

- Can be easily recrystalled for whatever frequency you need

I am asking $75 plus shipping/COD for this radio, however, I am open to
offers.

Is there a decoder for the 2 tone paging that many fire departments use? In my area (Suburban Chicago) most towns use sequential audible tones for fire paging and dispatching. I can decode the DTMF paging with my CD-1, but not the other formats.

Does the DC440 or the paging boards for PC's cover these non-digital paging tones?

Easily explained.

Many Cb operators use illegal power amplifiers. They also modify their
equipment to the point they transmit a very dirty signal. This signal can
overload many devices, causing the unwanted signal being heard over the
phones.

I tried the Ramsey SCA-1 kit. It worked but reception is noisy. I suspect
there isn't enough filtering to keep the stereo (L-R) component of the
main channel out of the circuit.

As for the freq's for the Blue Angles and Naval Air Station, Fort Worth, Carswell Field, Joint Reserve Base (whew!)...

123.400 Blue Angels - Common Control (?)
123.450 Blue Angels - Common Control
134.100
141.560 Blue Angels - Maintenance Charlie
142.000 Blue Angels - Maintenance Alpha (AM) - Repeats an Air-to-Air
142.025 Blue Angels - Maintenance Delta (Repeated on 142.625)
142.260 Unknown Use
142.265 Unknown Use
142.625 Blue Angels - Maintenance Delta (Repeats 142.025)
143.000 Blue Angels - Maintenance Bravo (AM) - Repeats an Air-to-Air
143.600 Blue Angels - Maintenance (Channel 10 ?)
241.400 Blue Angels - Air-to-Air
245.900 Blue Angels - Air-to-Air
246.400 Blue Angels - Air-to-Air (Soloists ?)
250.400 Blue Angels -Team Leader*
250.500 Blue Angels -Team Leader
250.800 Blue Angels - Air-to-Air
251.400 Blue Angels - Air-to-Air*
251.600 * Blue Angels - Aircraft 5 and 6 - The "Soloists" [Preset 8]
251.800 Blue Angels - Aircraft 5 and 6 (?) [Preset 19]
263.350 * Blue Angels - Flight Line Common (Aircraft Maintenance)
263.500 Blue Angels - Air-to-Air
275.350 * Blue Angels - Aircraft 1-4 (The "Diamond")
302.100 Blue Angels - Talkback (?)
302.150 * Blue Angels - All 6 Aircraft [Preset 17]
307.700 * Blue Angels - All 6 Aircraft (Alternate) [Preset 16]
318.900 Blue Angels - Air-to-Air
345.900 Blue Angels - Air-to-Air
348.600 Ground Support (?)
360.400 Blue Angels - Soloists (?)
362.600 Air Show Control (?)
363.350 Possibly a typo on one list of 263.350 (?)
363.500 Possibly a type on one list of 263.500 (?)
382.500 Blue Angels - Air-to-Air

384.400 Blue Angels - Air-to-Air
391.100 Blue Angels - Air-to-Air
391.900 Blue Angels - Air-to-Air
394.400 Blue Angels - Air-to-Air*
395.500 Blue Angels - Air-to-Air
395.900 Blue Angels - Air-to-Air

* = Heard in San Diego at Blue Angel shows - Confirmed.
251.600 is Aircraft 5/6, the Soloists
263.350 is Flightline Maintenance - "My Plane's Broke, FIX it!"
275.350 is Aircraft 1-4, the Diamond Formation
302.150 is All Aircraft (Used at Friday Show)
307.700 is All Aircraft (alternate - used only in practice this year)

Most air comms should be AM while ground crews are most likely FM.
Although no ground crew was listed for the Blue Angels, check out the
140 MHz stuff for that. Also, the 142.025/142.65 is likely a repeater
output/input.

DA>e-mail your questions to danderso@nyx.net).

If you are referring to the DS8000, it will "descramble" frequency inverters
very nicely. This is probably what is used on cheap phones, but I haven't
tried to decode them. I use it on the rare occasions when law enforcement
use cheap frequency inverters.

One problem with the system it that the PL tone the law enforcement uses
gets mixed to a very audible tone after the DS8000.

In case you don't know what frequency inversion is, they simply take the
audio band and reverse the spectrum. That is, low frequency is now high
frequency and vice versa. It is done with filters and mixers. The DS8000
give you 4 possible mixing frequencies. Even if you are off a bit in
frequency, the message gets through. It is like tuning a sideband radio.

I have never used an R1 but have an AR8000. From all the posts I have seen, the AR8000 is the CLEAR winner!
It is completely computer programmable as well!

The answers are yes and yes. The reasons are many, but the advantages clearly outweigh the disadvantages. It
is a do-all scanner, and it will take some time to figure out the unit. It is easy to input frequencies,
however, and is completely computer controllable. It is the ultimate handheld scanner. If you are interested

They probably use the SAR freq in the marine band. I can't remember it off hand but its listed in Haruteq. I think its 157.125? Check my page under scanners and/or follow the link to Ron KATZ's page. He's probably got it listed. Last time I listened to Halton police's marine unit on that frequency talking to a Coast Guard helicopter. The HRPD had asked for a helicopter to come down from trenton so help search for a kid who had jumped into 16 mile creek while be chased by police. They figured he had drowned (he didnt, turned himself in the next day!). Anyhow, the marine cops were talking to the chopper on this marine frequency. Its listed in all the scanner books as Coast Guard Search and Rescue.

Good advice. I have the SE regional directory from Percon. It is expensive! The best value is the Percon
Spectrum. It does searches for the entire country and gives you an 80 column printout! Best of all, it does
not have to be installed to work!

I've heard the Canadian Coast Guard use 157.125 for their SAR work in the Metro area/Lake Ontario. CCG SAR aircraft also use 5717 KHz HF (USB) or phone patches on the public correspondence channels (find yourself a list of marine frequencies for the Great Lakes) to contact the Rescue Coordination Center in Trenton. Metro Police marine units are on 861.1875 but can use any Metro Police channel (as well as marine channels). Lifeguards along the beaches use this channel too.

-- Many pay phones are privately owned these days and may be rather
cheaply designed/made. RF from CB as well as ham transmitters often
couples into electronic phones through unshielded phone lines or plastic
cases. The interferance, likely from the semi, could have been from
someone close to you as well.

: You heard ch. 20

I thought police call didn't list phone frequencies. In mine the only blurb they make is to list that the freqs 824-849 and 869-894 are deleted from scanners sold in the US. They don't say a peep as to what these frequencies are used for. Nor do they mention the cordless freqs anywhere. Mine is the latest one, 1996.

Radio Shack PRO-2006 scanner

Includes the following enhancements:

HB-232 external computer interface, with software.

6400 channels in 16 banks, selectable via the keypad.

LED S-Meter.

Automatic tape recorder control.

Full 800 MHz coverage.

Box and user and service manuals included.

Price - $650

Icom R-7100 Communications Receiver
---

25 - 2000 MHz. Full coverage model.

Excellent condition.

Ramsey Computer interface and software.

Box and user and service manuals included.

Price - $1300

Will deliver both in New England area.

1292. Wrigley field area freqs???

Newsgroup: rec.radio.scanner
Date: 1996-06-21 00:00:00 UTC
From: rgarrett@iquest.net
Message-ID: <4qf6mo$fhk_002@and-002-241-122.iquest.net>
Source record: 231196

Hi all,

Will be in Chicago on July 3,4,5. We'll be attending a Cub's game while we're there, I'd like to find freqs for Wrigley field ops/security, etc. And, since I don't know the geographic layout of Chicago very well, what is some likely monitoring while I'm in that area? Our hotel is in Des Plaines, which I understand is near O'Hare, so I'll try to do some aircraft monitoring while I'm there.

Thanks for any help you might be able to give,

Rick

Is this scanner really as good as the salespeople claim it is? None of them really know anything about it except that it picks up freqs straight from 25-1300Mhz, except cellular. They really have made no attempt to familiarize themselves with it, and are generally pretty scanner ignorant. If anyone has any experience with it, can you let me know what features it has? Or anyone know a good alternative to this scanner? I'm looking for a handheld that covers all those freqs. I currently have an older Pro-51. Thanks.

1296. Third Part Pack for 3000XLT ??

Newsgroup: rec.radio.scanner
Date: 1996-06-21 00:00:00 UTC
From: hay145@aol.com
Message-ID: <4qdujq$aai@newsbf02.news.aol.com>
Source record: 231295

I have several battery packs for my UBC-3000XLT but wondered if anybody knew of any packs done by anybody other than Uniden ??

From memory Metro West used to have various options for the 200XLT - do they do anything for the 2500/3000XLT. Even better would be something that would take AA's. If the 3000XLT proves as popular as the 200XLT perhaps this is something somebody might look at...hopefully.

Harry.

> I'm thinking of buying a UBC 3000XLT. Are there any differences (other
>than the obvious) between it and a BC 3000XLT (for U.S. use)? I assume
>they are identical (for example, battery packs are interchangable, etc.).

They are just the same. I found just one battery pack limiting so bought two spare ones and try to keep one in the car charged up all the time.

>Also, can someone with one of these tell me whether the tuning step sizes

>are always automatic or can be automatic or selected.

The 3000XLT selects the tuning/increment step it thinks should be used for the frequency entered although this can be changed if you wish to any one of the other available steps so Yes it is Automatic but also selectable if its not what you want.

The same apples to the Mode - can be changed at anytime. There is undocumented feature that allows you to turn this feature off - in other words you are unable to change mode from the default setting.

If you haven't been in contact all ready I'd reccomend Javiation as a source for the UBC varient. Very helpful, friendly and I've received great service.

Harry.

Quickly:

MVT-7000 8-1300MHz (although accept freqs down to 500KHz)
100 Channels.
AM, NFM & WFM. Increment steps 5, 10, 12.5, 25, 50 & 100KHz

MVT-7100 500KHz - 1650MHz
1000 Channels
AM, NFM, WFM, LSB & USB.
Various Increment Steps down to 1KHz (50Hz on SSB).
A few cosmetic improvemnets inc Backlit Keypad.

MVT-7200 Improved MVT-7100 in some areas with tighter SSB performance,
internal ferrite bar anttena for MW. Backlight now stays on "all
the time" if you wish. Grey rather than Black finish.

Other (earlier) sets included the MVT-3000, 4000, 5000, 6000 & 8000 for
a little more background info http://www.demon.co.uk/javiation/yupi.html

Helo all,

There's something new out on the market since a couple of weeks.

WiNRADIO by Rosetta Labs, Australia, is an all-mode scanner from
500 KHz all the way up to 1.300 MHz. It sits on a 16-bit board
that you plug into a slot in your PC. You control the whole thing
by software (demo looks great!!!)

I wonder if anyone has tried (or bought) this 'scanner-board'
and is able to tell me how it performs.

Thank's a lot

The USA version has a WX key which searches through the NOAA weather
radio frequencies. I don't know what the non-USA versions have
instead of the WX key.

How about starting a cassette recorder when your local police/fire/EMS service is activiated? I just bought an old BC-III and only installed police, fire and ems frequencies for the commuinty that I live in. My wife gets lost with my 200 and 400 channel scanners but has not trouble with just volume and squelch on the BC-III to find out why the fire whistles just went off. If I find another crystal scanner REAL cheap (I got this one for $5) I might just make my own "Minitor" and let it scan fire/ems both of which are activitaed with dual sequencial tones. I would mute that one and only turn on the audio/start the tape going when a call was activiated. Just a thought.

Anybody got a "master list?"

I just started working at a radio station (WOTS-AM 1220, that great little 70's station!), and we're located right in the Old Town attraction complex on the Hwy 192 strip in Kissimmee. I'm looking for frequencies... Disney, motels, attractions, security, and whatever else. Lotsa handheld radios in use here, so I'm sure there's more to be heard than what I've found so far.

Okay...since I'm asking for frequencies, I'll do my part and give some in return. Our Marti (remote pickup) frequencies are 161.700 and 161.730. Tune in on Saturday nights and you'll hear the live feed of our "Saturday Night Cruise" that we do live from Old Town!

>comments on the AR8000 will be much appreciated.

If you don't need the computer interface and the alpha-numeric
display, you should consider the Yupiteru MVT-7100 or MVT-7200.
Most people who have compared them side-by-side consider the
MVT-7100 to be a slightly better pure "radio" than the AR8000, albeit
without all the bells-and-whistles.
The 7100 is available from Canada and Europe. The new 7200 is not
available in Europe... we'll have to see where it will be
available from.

Either of them is MUCH better than either of their somewhat
comparable predecessors, the R-1 and the AR1000/AR1500.

The WX key for quick NOAA access is the "Turbo" key on the UBC varient.

"Turbo" on the BC-3000XLT being accessed by Shift + ?? (Can't just recall)
with that key combination doing nothing on the UBC.

You probably should check out a copy of the ARRL Antenna Book from your local library. In general, a yagi consists of a dipole cut to the frequency of interest and tuned usually using a gamma match. The dipole (called the driven element) is then attached to a boom. One element - about 5% longer than the driven - is placed behind it. This element is called the reflector. A series of elements are then placed in front of the driven element - called directors - each progressively about 5% shorter than the previous one. The seperation between each element can be played with to achieve the best pattern, but I believe that usually is about 1/4 wavelength between the director and the reflector. I am not sure about the distances between the director and the driven elements.

Just for the edification of anyone likewise curious, I learned very shortly after posting my query (wouldncha know it) that it is indeed 20 years later: these little wall jacks do indeed double as power supplies just like the label says, and not just as rechargers. Wasn't always so, folks. And I never got the memo. :) No one responded yet, so I thought I'd better clear that up right away myself.

I have always wondered about these things as all computers put out so much RF "noise". I just don't see how you could keep the noise out of a receiver/scanner card, even with special precautions.

I have had a couple of good scanners, Radio Shack 2006, etc., and I have always had problems with my home computers getting into them. I always use an outside antenna with double shielded coax to the scanner, as well. The computers are FCC rated for home use - the lowest noise allowed.

Most specific freqs come in OK, but you can forget about search if one of the computers is on!

A "legal" CB radio can interfere with a telephone. Many times it is a problem with the phone/line that is the problem.

I used to be heard on clockradios and telephones immediately around my house when I used a "barefoot", unmodified, type accepted CB.

Ask any ham about telephone interference - there are cases in amateur radio (most cases actually) where the operator and his station are in full technical compliance - but it doesn't eliminate the trouble. Often you have to make modifications to the device being interfered with to solve the problem.

BC-2500XLT 400 channel scanner for sale. 30 - 1300 MHz, full 800 MHz coverage. Has AM, narrowband FM, and wideband FM modes. In excellent condition, works perfectly, no problems of any kind. With antenna, charger, two nicad battery packs, manual, in original box.

This unit is essentialy the same as the current BC-3000, which is cell-blocked; the BC-3000 retails for over $350. I'm asking $295, shipped UPS/Groundtrack/insured anywhere in the lower 48 states. Email if interested. Thanks.

I have the PRO-2026 scanner and use the Grove No-tenna.
I can recieve AM & FM, across the whole range of the scanner very well.
The reception is almost as good as any of the several roof/mag mount
antennas I tried.
Considering it can't be seen from the outside AT ALL, I consider it
superior.
Thieves don't look at my car for an antenna, and I can cruise around and
no one knows I'm listening.

PS . No short piece of wire can pick up the CHP like my no-tenna can!
cheers

(Continued from previous message)

Incredibly, 144-148 and 420-450 MHz were included on the list!

This is the first time in memory that another service has been proposed for the two-meter amateur band. We must make sure it is also the last time.

We do not need to explain to ARRL members the extensive use that is made of these bands by amateurs. The two bands provide the backbone of our local public service communications effort. Voice and data, mobile and fixed, even television--the list of present amateur uses is a long one, and of future uses is even longer. Both are already used for satellite services and for moonbounce and extended-range terrestrial operations requiring extremely sensitive receivers and high levels of effective radiated power.

Apparently we did need to explain all this to the little LEO industry representatives, so we did just that--both at the meeting and in a followup letter on May 15. We also explained that we had to regard the matter as extremely serious. No one with the slightest background in radiocommunication could possibly believe that a mobile-satellite service could be introduced into either band without disrupting existing and future amateur operations. Therefore, we said, if we did not receive assurance that they would be taken off the list of candidate bands by the deadline for this issue of QST, we would have no choice but to bring the matter to the attention of the entire membership.

The response we received was unsatisfactory. In effect, we were told the little LEO industry would consider our views but that until their spectrum needs are satisfied, all bands must remain under consideration.

So, this is a call to action. We must get across to the industry and government participants in IWG-2A that the 144-148 MHz and 420-450 MHz bands cannot be considered as candidates for mobile-satellite services. We need to drive the point home so forcefully, with so many grassroots responses, that no one is ever tempted to try this again.

Which brings us back to that invitation for "interested parties" to send input "at any time." There's no time like the present! According to the Commission's new procedures, comments by e-mail should be sent to: wrc97@fcc.gov. Written comments, with an original plus one copy, should be sent to: Office of the Secretary, Federal Communications Commission, Washington, D.C. 20554. Each comment should include at the top, "Reference No. ISP-96-005" and "Advisory Committee Informal Working Group 2A." FCC staff assures us that comments will be given prompt

consideration, and asks that parties refrain from filing comments in accordance with previous instructions.

Do comment. But be civil. Don't abuse people who are simply doing their jobs. We have to get across that casting covetous eyes on amateur bands is counterproductive, and contrary to the public interest. To accomplish this we need a lot of comments, including yours. But remember that the objective is to educate and persuade, not to intimidate. We don't need to. The facts are on our side.

==========

For the latest news on this particular issue, check the ARRL Home page at www.arrl.org and click on "Band Threat News."

Then write. Right now!

David Sumner, K1ZZ

==========

FCC Public Notice:

Procedures for Submitting Comments to the WRC-97 Advisory Committee

June 6, 1996

On March 14, 1996, the Commission released Public Notice (No. 61997) (Streamlining Notice), that announced its new streamlined World Radiocommunication Conference (WRC) preparatory process.

Under this new process, formal Notice of Inquiry (NOI) proceedings are eliminated in favor of developing WRC proposals in the Commission's WRC-97 Advisory Committee. This removes the redundancy that was inherent in our previous "NOI-WRC Advisory Committee" process and enables the United States to respond more effectively to the rapidly evolving international environment and to the ITU's new two-year WRC schedule.

The Streamlining Notice included general guidelines for submission of public comments to the Advisory Committee. The Notice stated that procedures would be developed to ensure that members of the public continue to have full opportunity to participate in the development of WRC proposals under the new streamlined process, including those parties who do not attend meetings of the Advisory Committee and IWGs.

Since the release of the Streamlining Notice, we have gained experience with our new process. We now provide these procedures for submitting comments to the Advisory Committee.

Comments on Ongoing Advisory Committee Matters: Parties that wish to comment on the ongoing deliberations of the Advisory Committee and its IWGs may do so at any time.

Source record: 231336

(Continued from previous message)

Comments on Preliminary Proposals: As announced in the Streamlining Notice, preliminary WRC proposals developed by the Advisory Committee will be released by the Commission in periodic Public Notices. These Public Notices will allow an opportunity for public comment and will provide the appropriate procedures, such as filing deadlines, to be followed.

In either case, parties wishing their comments to be considered directly by the appropriate Advisory Committee group and to become part of the Advisory Committee's public record should submit their comments in writing to Office of the Secretary, Federal Communications Commission, Washington, D.C. 20554, or by e-mail at wrc97@fcc.gov. Commenters are requested to file an original plus one copy.

The comment should reference the Advisory Committee public record file number, "Reference No. ISP-96-005" and the appropriate Advisory Committee Informal Working Group, if known, in which their submission should be considered. The FCC staff will ensure that comments filed are considered in the appropriate groups.

For the most expeditious and efficient consideration of their comments, parties should refrain from filing comments directly with the Chair of the WRC-97 Advisory Committee, with the Chairs and Vice-Chairs of the Informal Working Groups, with individual FCC staff members or private sector participants in the Advisory Committee process.

For additional information, contact Cecily C. Holiday, Federal Officer of the WRC-97 Advisory Committee, or Damon C. Ladson, Alternate Federal Officer at (202) 418-0749, or consult the WRC-97 Homepage on the Internet http://www.fcc.gov/ib/wrc97/.

I had this same problem with a 100xlt (same battery pack as a 200xlt), I
found a wire inside my battery case that had been crimped in the middle,
breaking the wires and causing an intermittent problem. I replaced the
wire, and had no more problems.

The frequencies that NASCAR uses the most are 461.200 and 463.625.
Current frequencies for drivers and NASCAR are for sale at the tracks
from the companies that sell scanners. Check with Frequency Fan Club or
Racing Electronics at the track.

Motor Racing Network (MRN radio announcers) use 454.000

1347. Any ideas on power anomaly w/ Bearcat 200xlt?

Newsgroup: rec.radio.scanner
Date: 1996-06-21 00:00:00 UTC
From: dwatt@unixg.ubc.ca
Message-ID: <4qcpnv$ib8@nntp.ucs.ubc.ca>
Source record: 231377
Cross-posted to: alt.radio.scanner,rec.radio.scanner,alt.radio.scanner.uk

A peculiar situation has emerged with my Bearcat 200xlt. Earlier this week I turned-on the unit and found that nothing happened. After some trials I found I was able to operate the unit via the plug-in power adapter, and that if I removed the adapter plug while the unit was on, the battery power kicked-in and I could use the scanner normally.

However, every time I turn the unit off, I have to 'jump-start' it again with the plug-in adapter before I can run off of the batteries. This, obviously, is a big pain in the ass.

I opened up the battery pack and inspected the small circuit board inside. No apparent damage or burn marks. Am I right to assume the problem lies with this circuit board as opposed to the upper scanner circuitry? (Unfortunately I don't have another battery pack available to try). Does anyone have any ideas about which components might be at fault, how I might investigate further, or how to actually fix the damn thing? Any input would be much appreciated at this point.

Cheers, Dave

Be careful about that mod. If you try to go too fast, the CPU in the radio overheats & dies. You may not be able to get your front panel replaced nowadays. The radio is old, and out of spec as per the ECPA. Contact bcheek@cts.com or check out his scanner modification handbooks for details. If anyone out there has a 2006 with a dead CPU, you might try installing an OS456. It "takes over" the CPU functions.

I've just had to replace ni-cads in the battery pack for my 220xlt
becauase of the same thing, I jusy bought some normal nicads and
soldered them together, they are a bit tricky to fit back into the case
but it can be done.

>becauase of the same thing, I jusy bought some normal nicads and

I have the same problem, and it has deteriorated over time. I haven't replaced the batteries, because they're not at fault. The problem is that the radio needs a higher voltage to turn on than the batteries can deliver. Using the adapter raises the output of the battery pack a bit so the scanner will turn on.

As I said, it may grow worse over time. If I want to turn my 200xlt on I need to apply 10 Volts to the unit. After it is on, the unit runs happily on the batteries (a good 10 hours or so). I can even measure the voltage it needs to start by connecting a regulated power supply directly to the unit, not using the battery pack. When inserting the adapter still worked, it would need 8 Volts, now it needs 10.

Another side effect is that if I attempt to scan then 470 and 900 MHz bands, the scanner will deactivate itself.

I don't have a solution, other than taking your radio to a repair center. The 200xlt is filled with proprietary components, so repairing it yourself would get a bit difficult, even with the tech manual, I think. I'm still interested what the problem is, though.

Ah ha! You've been `caught?' by the tarnished power jack switch syndrome!
Whats happening is that the contacts in the power/charger jack are silver plated
and have tarnished enough that there is a slight insulation film between them
and when you plug in the adapter to `jump start' it and then remove the plug
they snap back together *just* hard enough to break through. The `cure' is to
just replace the jack. (You *can* temporarily clean the contacts but it'll come
back with shorter and shorter periods between cleanings.) As an ower of both a
200xlt and a 205xlt with two packs each I've gone through this several times now
and the only sure cure was replacing the jack.

Doleo ergo sum,

What you undoubtedly have here in these machines is at least 1
duff cell. This cell drops its bolts before the others and is in
effect reverse charged by the others as you continue to use the
radio. It acts like a resistor in series with the remaining good
cells. This means that any action that increases the current
drain will drop the volts and the set will cut out.

Get a voltmeter and measure eaxh cell UNDER LOAD. The dodgy cell
should be replaced. This is a NiCad problem. Reverse charging
soon ruins the cell involved of course.

Reasons to decode Fire paging tones:

1) Curiosity. I just gotta know!

2) Information my readers want. I have had several requests for this info
so readers of my books can set up alert receivers on the local fire nets.

3) To set up my own alert receivers. I have a half dozen or so Plectrons
that I would like to set up sometime on some of the local fire channels.

4) For use in my work. I am in charge of setting up our new Comm room,
and also assist other area departments in frequency, PL, and equipment
selection.

5) I like toys (much to my wife's angst!)

From: Scott Ryan <crtoy@fyiowa.infi.net>
Message-ID: <4qgq59$cai@nw101.infi.net>
Source record: 231208

Forget the BCT 10, bad audio, poor reception, no 800 mhz coverage, only
512 pre-programed freqs. (I think), no weather or CB.

The BCT 7 is a much better scanner & allows 100 user programed freqs.
I've have used both and highly recommend the "Seven"

1374. Monitoring Trunked Systems

Newsgroup: rec.radio.scanner
Date: 1996-06-22 00:00:00 UTC
From: penguin@halcyon.com
Message-ID: <4qgqdv$ccm@news.halcyon.com>
Source record: 231209

I'd like to hear opinions on what is the "best" way to monitor a trunked radio system.

My local public safety agencies (Seattle police and fire) have more or less converted to a new 800 MHz analog trunked system. The system has been in existence for a couple of years, but they were simulcasting on their 400 MHz channels up until recently.

Is there a particular strategy that one should try? What has worked for you?

Thanks for your thoughts.

From: scosgt@worldnet.att.net
Message-ID: <4qh6is$7rh@mtinsc01-mgt.ops.worldnet.att.net>
Source record: 231210

My AOR 1000 won't chage from an ac adaptor (tried the original, and a RS replacement).
However, it charges just fine from the 12V car cord. Have been charging it from a 12V power supply with the car cord in the house. Replaced the batteries, so that's not the issue. Anyone got any ideas why the AC adaptor will not work (again, not a bad adaptor. tried another!)
Thanks

Anyone know of any audio mods to increase output levels (headphone jack) on handheld scanners?

I'm mainly interested in mods for BC Sportcat. I need increased audio output for use in a Sportsman stockcar.

I know that companys specializing in race communications offer these mods on scanners they sell.

Tried the BCT 10. Too many false alarms (one alert lasted from San
Antonio to north Texas) . On the hiway, the sound quality using
inside speaker is pitiful. Too limited on user oprions. Good idea
but thumbs down.

Just installed the BCT-7. Liked it well enough to mount permanently.
Sound is very good- not all treble like last one. The user options
are worth every penny of the twenty dollar difference in price.

The "alert" theory is a little shaky. Using the mobile extender's
transmissions may not prove effective as a warning if the dispatcher
isn't very talkative, then the radar detector is still needed.

Another approach to monitoring subcarriers is to use a general coverage receiver of capable range,operating in the FM mode. I have used this approach for several years and have found it to be superior to other methods.

1380. Dynamic Scanner Banks

Newsgroup: rec.radio.scanner
Date: 1996-06-22 00:00:00 UTC
From: Tom Howley <tom.howley@moa.net>
Message-ID: <19960622151847.aaaa000Fp@babyblue.cs.yale.edu>
Source record: 231215

Has this subject been brought up before? I was just at Uniden's home page to see if it had any new stuff on it and it occured to me I would be very happy if there were variable bank sizes on some of these radios. A 200 channel scanner for me has at least 50-100 wasted channels in it because I usually like to put my freqs in related groups that I can turn on and off easily. If you have police and fire in the same bank and there is an exciting fire call, you probably would want to disable police quickly an just allow fire calls. Problem is when you put a few police freqs in one bank and a few fire freqs in another bank, you end up locking out 10 or more usable channels in a bank.

It would seem to me dynamic bank sizes are something I could use to stretch a 200 channel scanner a little farther. What do you all think.

Or is there already one out there with this feature?

I dropped Uniden an email with my idea, I hope someday it comes true!

Put in all the frequencies in your particular trunked system and hope for the best. You'll probably have to check each day for the "data" channel and lock that out. You'll have to do that each day, as it's different each day. I HATE trunked systems.

From: hh357@aol.com
Message-ID: <4qhp3j$oi4@newsbf02.news.aol.com>
Source record: 231222

Another suggestion regarding trunked systems:
Some scanners now include a "not data" button. By pushing this key you make the scanner automatically skip over any Data or control freqs.

That way you just program all the freqs in, and don't worry about changing the lockut every day.

In addition, Bill Cheek has a modification in his book #3 to add this feature to scanners, like the pro200x and pro2035, that already have a Sound Squelch function.

>you plan on talking on the CB, and want to be heard more than 50 yards
>away. If you're planning on mainly listening on the CB, not talking,
>the shared antenna will probably be acceptable.

Forget using the car ant for CB you MUST use a proper cb ant, which
you can split the car radio into buy use of a switch box to switch out
one unit and in the other but WARNING you must put a dummy load across
the cb when the switch is to the car radio otherwise if somebody
presses the ptt button on the cb when there is no ant connected you
run a very high risk of burning the tx unit out.
Its quicker and possibly cheaper to stick a mag mount on the car for
the cb.

1398. Scanner Patrol

Newsgroup: rec.radio.scanner
Date: 1996-06-22 00:00:00 UTC
From: Steve Arnold <SuperTrack@gnn.com>
Message-ID: <31CCA157.937@gnn.com>

We sometimes go on "Scanner Patrol" Friday and Saturday evenings... chasing down the calls for excitement, or go to the airport and watch takeoffs, listening at the same time... BUT, I found the neatest thing...

Radio Shack sells this Cassette/CD adapter to play your portable CD player through your in-dash cassette player -- works GREAT for hooking up a portable scanner through the headphone output and fills the inside of the auto with the big sound...

Just thought you might like to enjoy like I do...

Brian,

Here are a couple to get you started. USCG Vessel Traffic Service (kind of like air traffic control for ships) is on marine Channel 14, 156.700. Foss maritime on 156.350 and 156.900. I've mislaid the State Ferries freq. Maybe someone else will post it. Let me know if you need more.

> on and off easily.

Absolutely.

Of course you can always get a RS Pro 2004/5/6 and do the 25,600
channel memory mod, giving you 640 banks organized as 64 "superbanks".
You only get to use one "superbank" at a time however. It is sort of
like having 64 scanners, of which you can use only one at a time.

But with that many channels and banks you can afford to waste a few,
or even a bunch, out of each bank.

I believe that it is generally the case that mobile units have
lower-powered transmissions and don't have the benefit of a more or less
ideal transmission site like a tower or hilltop. I can sometimes pick up
the CHP units if they are close by but often I just hear the dispatcher.

The CHP operates on a number of frequencies in the 42 mhz range. They use
a duplex operation with pairs of base and mobile frequencies. If you
don't have the mobile freq programmed, you won't hear the unit.

If you have some questions about frequencies in use in your area I will
look them up and mail them to you.

Wow--that's a tough one. I like listening to railroad transmissions as well as the LA County fire department and Sheriff's department. I suppose that the LAPD would be interesting, but I don't normally program their freqs into my scanner.

If you have some particular area of interest perhaps I can look up some frequencies for you.

The only way to control the printout format, and get a workable report, is
to massage the data by exporting the records you are interested in to a
data base program and run the report from that program. It's a hassle,
but at least you will get the report that you want.

Rich:

I will try to find the decode I saw the other day in a catalog. It had DIP switches to set what tones to decode. You had to provide a source of audio, and it had a relay to control what ever you wanted.

You could wire it to set off a buzzer and unmute the scanner audio or something. And ONE scanner's audio could be fed to several decoders so that you could receive alerts from several agencies.

BEST of all, it was only about $25.00.

One problem. You would have to know the tones that are used for each service. You would also have to know if these are Motorola or Plectron tones. (they are different in tone an format)

But you could do it. Something to play with for sure.

It was reported in the Phoneix Newspaper and by the Television and Radio Stations that someone has been stealing radios from Fire department equipment that has responsed to fires or other emergencies. So far, it has been reported that the losses are in excess of $20,000 There have also been some fake fire and police calls. Most recently, a fake officer down call was broadcast that sent police units from all over the city scrambling to the area indicated in the fake call.

Anyone with info on this should contact The Phoenix Police Department or your nearest local Police department.

It's a serious crime to broadcast fake or fraudulent distress signals... whoever is doing this should be hung out to dry!!

>then why shouldn't I use them.

Part of this is true and part isn't. AOL only allows the use of its trial twice a year on the same credit card. Your card number is kept online for 6 months, as I'm sure some of you know.

I don't have anything against the people who use AOL, there are lots of people on their service that are very knowledgeable, but then there is a small percent that have no idea what the internet is, how it operates or do they even give a shit. Although small they really are a bunch of assholes. They are not alone.

Earthlink=Nothing but a very large percent of spamming jerks.
GNN=Same shit!

Although AOL will correct a user or repremand them, earthlink and GNN don't do shit.

Any person that has been on the internet, WWW, newsgroups for one week and says he/she doesn't know what a spam is has got to be stupid.

So after some idiot posts in 150 newsgroups about getting rich, come to my free xxx webpage,
or what ever "I feel justified in sending him and his postmaster" a nice FAQ sheet on the netique(?).

I'm getting off subject.

Peace.

,\\ichael

I ran across quite a few that were dropped in water here.
(I used to work at a cellular phone repair shop.)

Displacement with >90% alcohol does not always get all
the water out. If the water was contaminated, I would
definitely do this first. (My brother dropped his in the
toilet. Yuck!)

However, if this was fresh water, we skipped this and went
directly to step 2. What we did was take the cover off and
leave it on the dashboard of a car (in the sun) for about 15
minutes.

That dries EVERYTHING. Display might turn dark, but
it seems to be okay as soon as it cools back down.

Sun's a lot stronger here, so cooking time may vary. :-)
(Of course, as always, this is at your own risk.)

I've fallen in love with the AR-8000 from the literature I've seen so far on the web. My one qualm is that most of said literature was made available by those trying to sell this unit. :) Can anyone tell me if the $600 street price I've been seeing is worth what you get? I'd also be interested in any recent print media reviews.

Thanks for any info!
Chris, N1KEX

1432. FS/FT Recent Pro-43 Excellent condition $225.00/trade

I would have to say that's probably Sun Country Airlines. I know they fly out of Minneapolis to all over the U.S. The Sun Country flight I took was from MN to Texas, so anywhere along that route they can be heard.

Well then tell me, is it a good scanner? Does it have the same problem mentioned above, with not pulling in 1,000-1,300 Mhz as the earlier version did? And I'm not putting it down because of one ignorant person, I'm putting them down because every RS store I've been to had ignorant people, no one could refer me to anyone who knew more.

Possibly, that would explain my radio turning off when scanning the higher frequency bands or while attempting to program a frequency.

However, when I connect a regulated power supply directly to the main unit (sans battery pack) it still won't turn on until it gets 10 Volts. This part of the problem thus has nothing to do with the battery pack.

What is the differance between Motorola and Plectron tones?

Also, I've recorded my fire company tones, used a frequency meter on the computer to find out the frequency then used the computer to generate the same freq. tones (cleaner, no static) and have set of pagers and sirens playing the tones through a portable radio on our dispatch freq.(with permission from the dispatch center. They said it couldn't be done, but it worked!) Their base console is a Motorola.

And I would be VERY interested to find out about the decoder you are talking about.

Police/Fire and other goverment agencies will share a block of frequenies. One of the frequencies is set
aside as the data channel and it controls which freq to use. The best way to listen to them is to turn off
all your delays and lock out the data channel. You can tell which channel is the data channel because it will
be an anoying buzz sound. Most places will change the data channel on a regular basis (once or twice a day)
so you will have to scan all the channels and lock out the data channel everytime you go to listen to them.

I don't know the technical stuff behind them, but this is what was explained to me and it works well for me.

If your into listen to the police, the most interesting freq. to listen
in on are the tac channels. (I assume you have the dispatch freq., if
not I can get you those also).

LAPD Tac Channels
154.8300 Air unit & K-9 unit calling
154.7700 Investigative services
154.9950 Robbery/Homicide
154.7550 Burglary/Auto theft
154.9650 Juvenile Division
506.8125 Tac 6 - West Bureau
507.0375 Tac 7 - South Bureau
507.0875 Tac 8 - Emergency Trigger
508-5875 Tac 4 - Central Bureau
507.2625 Tac 5 - Valley Bureau
122.7500 Air unit
123.0500 Air unit
123.0250 Air unit
484.7125 Hot Shots/K9
507.0125 Air support
453.8750 Wide area
506.8375 Metro 1
484.5875 Metro 2/SWAT & Special Ops
484.7375 Detectives
506.5375 Staff and Command

You can also pick up Simi Valley PD all the way down in Orange County!
I live in Simi Valley and dispatch is on 160.7850

I don't know if they use the same freq up there, but in the LA area CHP
will use 154.9050 as a vehicular Extender. They also use 154.6950, but
I think that's just local to Ventura County (Purple Channel) repeats
42.1600.

Very typical, nuthin' unusual about that at all. See below.

> I believe that it is generally the case that mobile units have
> lower-powered transmissions and don't have the benefit of a more or less
> ideal transmission site like a tower or hilltop. I can sometimes pick up
> the CHP units if they are close by but often I just hear the dispatcher.

Simple. It's not that car radios are underpowered, it is that the
wavelength of 42MHz is too large for the small antenna on your
scanner to pick up efficiently.

A full sized 1/4 wave whip at 42 MHz is about 65" (1.6 meter),
versus about 20" for VHF-HI or about 8" for UHF. The small whip
or rubber duckie antenna on your scanner is simply too small.
Even a base antenna tuned for just VHF Hi and UHF is not very
good on the low-band.

Have you ever wondered *why* the CHP has those big antennas on
their cars? The CHP uses the low-band because it can cover large
areas more efficiently than the upper bands. The down-side is
that it does require the use of such large antennas.

Try using a CB antenna. I have had very good results picking the
mobile units up with just a cheap-o CB antenna. You can also tie
a 5 foot piece of wire to your scanner whip antenna to get better
reception. With the correct antenna, the reception is comparable
to what you would expect with mobiles on the VHF-HI band.

If you are in a crunch, try grabbing the scanner antenna with
your hand. Also try moving around, as the "dead-zones" are
farther between at these frequencies.

Decent reception in a car is almost impossible on the low-band
with a portable. The car chassis is a very good shield at these
frequencies and an external antenna is a must (or poke the

antenna out the window).

My car scanner has a external 19" VHF-HI whip. I can hear the
mobile units up to 1-2 miles away. The base station is always
nice and clear. Using a mag-mount CB antenna increases the mobile
reception range to about 10-15 miles.

In a nut shell, the antenna supplied with most portable scanners,
as well as a few base units, is not sufficient to receive the
low-band signals effectively (if at all). You simply need a
longer antenna.

A telescoping whip antenna for a handheld helps a lot.

> The CHP operates on a number of frequencies in the 42 mhz range. They use
> a duplex operation with pairs of base and mobile frequencies.

Yup. The base transmits on one channel and the mobiles transmit
on another.

Also; When the mobile units have to talk to each other (car to
car), they transmit simplex on the base channel. I find it is
easiest to just program in the base channels and the mobile
repeater freq.

The deal is the dispatchers are on one freq amd the cars are on another. So, if you want to hear both sides, you need to monitor both the dispatcher and car freq. Since the cars are not repeated (except with the mobile extenders) you will need a good HIGH outside ant. to hear much of the cars. I know as I used to live in CA. Also, in the big cities, the cars don't say much! It's not like local police, at all. In the rural areas the cars will sometimes chat with each other by transmitting on the dispatcher's freq.! That way, the dispatcher doesn't hear them! These conversations can be kind of interesting, at times. I don't know about S.F., but I used to get all the L.A. CHP frequencies, dispatcher and car, from the Gene Hughes "Police Call Southern California Edition" freq. guide at Ham Radio stores and scanner places. Really excellent book, new edition every year. There must be something like it for S.F. Hope this helps.... Dave

1450. Chicago (Midway) and Louisville Airport?

From: Charlie <charlie@pcix.com>
Message-ID: <31CD23C6.699B@pcix.com>
Source record: 231265

I'm considering the purchase of an AOR 8000 and have a few questions related to my decision...

Where is the best place to make the purchase? Javiation seems to have a good reputation, although I'd prefer to find an outlet in the US.

Can I get a better price in the US?

If I just want to tune the HF bands looking around for interesting CW signals, how does the AOR 8000 accomplish this? Is there a VFO knob that I can "spin around", or do I reduce the tuning step to minimum and hold down the "up arrow"?

What is the minimum tuning step (1 KHz ?) and how do you fine-tune an SSB of CW signal?

Thanks for your help.

Message-ID: <4qjjn0$23k@easy2.worldaccess.nl>
Source record: 231269

After a long time there was some Sporadic E reception today herein the Netherlands:
quite some stations from the Ukraine on the East-European FM Broadcast band.
Most interesting was Ukraine TV on channel R1 (audio 56.25 MHZ; while very strong TV signals were visible; logo upper left YT2)
The Ukraine TV station was mixing with 2 other TV stations:
one with a logo like the cipher 2 (upper left), the other was a station with the logo (upper right) DPT 1 (the 1 posed under the P).
Does any body have an idea which (eastern Europe) stations these are?

Another question : on audio TV channel E2 (freq: 53.75 MHZ) around 09.55-09.59 (23 june) UTC I heard an Arabic station, fading in during about 4 minutes: Arabic songs, female announcement.....Arabiyah.....
Anybodey an idea?

Now, around 13.15 UTC TVE Spain has TV signals on chE2 and strong audio on 53.75 MHZ.

Motorola and plectron tones are do not quite match. I mean that a
pager designated for motorola two tone only will not do plectron. The
frequency of the tones are different. BUT some companies make pagers
that will do both.

I can e-mail you documentation on the tones used by motorola and
plectron tones with their assigned id.

>on scanners they sell.

Hello Scott,

one of the problems with hand portable radios is the small size of the speaker - often the audio amplifier is pokey enough but the speaker can not handle the power.

Imagine the speaker as an engine (which is what it is.) When it is energised, the tube that has the voice coil wound on it slides up and down inside a circular slot in the magnet. When you turn up the volume (and over drive a small speaker) The voice coil tube literally hits the bollom of the slot. This does two nasty things!

1) The sound becomes very distorted.

2) The bottom of the voice coil tube becomes deformed and swells where it is constantly bashed on the bottom of it's slot (speech average at about 1000 times a second!) - This deformation will then "drag" in the slot against the wall of the slot. This causes distortion even when the radio is turned down.

The real solution is two fold.

One quick solution is to add an extension speaker. I have an extension speaker that is intended for mobile phones. It is elliptical 1.5 x 3 inches, in a very nice housing. I use it with an AR8000. There is then enough guts in it so that I can hear the radio at good sound level, even when driving fast(ish)... They are not expensive and very worth while investing in one for the car. I also have another one in the room - It sure does improve the sound - (volume and quality)

The other solution is a small audio amplifier - the problem here is the extra cost and the need to feed the amplifier with a fixed level of audio. If the radio has a "record" outlet, this is usually at a fixed level.

I have just picked this gem up from Steve Arnold's posting "Scanner Patrol" that should sort out your problem. I paste it here in case you

miss the original.

------ Insert part of "Scanner Patrol"
by Steve Arnold<SuperTrack@gnn.com>--------
>Radio Shack sells this Cassette/CD adapter to play your portable CD
>player through your in-dash cassette player -- works GREAT for hooking up
>a portable scanner through the headphone output and fills the inside of
>the auto with the big sound...
---------- end of insert ------------------------------

You can use the ear socket, but be carefull not to overdrive the
amplifier.

1462. Mod for Ramsey SS70a Descambler

Newsgroup: rec.radio.scanner
Date: 1996-06-23 00:00:00 UTC
From: phancock@escape.ca
Message-ID: <4qjsoi$50h@wpg-01.escape.ca>
Source record: 231276
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I have achieved dramatically improved results with the SS70a on descrambling speech inversion by replacing the 3.57 Mhz crystal supplied with the kit with a 4.00 Mhz crystal. Output went from unintelligible to easily understandable.

I took the mod a step further by installing a front panel switch that selects either a 4.00 Mhz crystal or a 4.19 Mhz crystal. This allows me to fine tune the local oscillator frequency to achieve the best audio for a given transmission.

Thanks for the help!

1465. Do trees improve reception?

Newsgroup: rec.radio.scanner
Date: 1996-06-23 00:00:00 UTC
From: Ultrix <ultrix@aimnet.com>
Message-ID: <31CD8742.789A@aimnet.com>
Source record: 231279

An intersting thing happened yesterday.

I like to listen to the Space shuttle when it is on a mission, so here in San Jose, I listen to it on 145.585 Mhz. I usually have very good reception and a small amount of noise. I have listen to all previous missions with no problems at all, until now....

Yesterday, I had to remove a tree that was growing just outside of my window. I decided to cut the tree down because it was growing way too close to the house and was starting to damage the roof. Well, after a hard days work with a chain saw, I decided that I would come in and listen to see what is going on with the shuttle. I turned on my scanner, and nothing..... This was a big surprise since I have never had any problem picking up this frequency any time that the shuttle was up. (The repeater is not to far from here....)

Does anyone know if the tree may have somehow made it easier for me to pick up weaker frequencies?? This is a bizarre question, but I am curious if any one could tell me why my reception diminished after cutting it down??? The tree was about 15-18 free tall, it did make contact with the storm gutters on the house and was fairly close to a small antenna I am
using. I am not sure yet but it seems if other stations have diminished reception too.

Any help or comments would be appreciated.

Thanks

Besides, most of the Interstates and the Turnpike are now up to 70
mph, except in town and in construction zones. I know the FHP has the
construction zones pretty well patrolled so they can pinch speeders
who crash and block traffic for the rest of us.

KR-TD1. This kit decodes (detects) any single PL, Tone, Tone Burst or
FSK note (from 10Hz ~5,000Hz)! $7.95

Use a pair of these and a few extra components for dual tone decoding.
Often the first tone selects a district and the second alerts the
specific station(s). The point is that a single tone decoder may work
to your advantage?

Use this same kit to Send a single note too. Great kit for A rookie.

>BA uses Speedbird as its call sign on ALL flights.

If by "BA" you mean British Airways, I'd like to toss in a story
for you.

Several months back, I was home from work one day while we had
some work done on our air conditioner. I was getting ready to go back
to work at about 1 PM when our area got boomed. Not any whimpy
sonic boom, either, but a big badass double-boom that rattled the
windows and window frames and made the birds all fly up out of the
ground/trees/underbrush.

First instinct - look up. Nothing.

Second instinct - run inside and fire up the communications
gear.

Nothing on UHF that would have indicated ANG activity in the
area (and that's who the USAF pinned it on after the fact), but I happened
to catch some traffic on 11175 KHz from an aircraft ID'ing as
"Speedbird324" and/or "QK324" (used interchangeably) that he was heading
to Brunswick, or something like that (in Nova Scotia, perhaps????).

My first thought when I heard "Speedbird" was Concorde, as I knew
they used that radio call. BUT, it was my impression that they were
banned from flying supersonic over the US. Some calls confirmed that,
so I got on the phone with both Air France and British Airways to see
if there was some reason why they might have a Concorde flying hot that
day.

Both of them said they did NOT have a Concorde anywhere but East
coast and they ALSO confirmed that they did NOT fly supersonic over
the US.

When I asked them about the 11175 communication they knew
nothing about it, so they said.

I might add, the FAA was real uncooperative. No, they knew
nothing about it. They never called me back, either.

The comm indicated an ETA of 50 minutes to the destination,
and if my figuring on WHERE he was going was correct, he was going there
in one helluva hurry. I also perceived that when this bird was talking,
everyone else on 11175 shut up. Often, 11175 tends to be "up for grabs".

(for those who don't know, 11175 is the freq. for the "mainsail" network,
which is a main communications hot spot for USAF's global communications)

Now, I *suppose* that it is possible that all of this stuff
had no connection. But I doubt it. I'd sure like to know what the REAL
story was, and I say that because the person who said that it was ANG
units said that they were op'ing WEST of town. Funny thing about that,
the local MOA is to the NORTHEAST. As a general rule, they DON'T do
most of their ops outside of the MOA around here. My gut feeling is that
somebody screwed up on their cover story. :-)

If anyone can shed any light on this, by all means, post and/or
email me.

Duane

|My AOR 1000 won't chage from an ac adaptor (tried the original, and a
|RS replacement).
|However, it charges just fine from the 12V car cord. Have been
|charging it from a 12V power supply with the car cord in the house.
|Replaced the batteries, so that's not the issue. Anyone got any ideas
|why the AC adaptor will not work (again, not a bad adaptor. tried
|another!)

This seems to me elementary process of elimination type trouble shooting! The first thing I would do is to get a Volt-Ohm-Meter with a current range.

(1) With the 12V car cord being used to recharge the battery, turn the radio off and slip one of the four "AA" Nicads slightly out of it's holder. Complete the connection between the battery and the holder with the VOM in the current mode; get a reading of the current flow. Then get a reading of the voltage starting at the "+" of the first battery and "-" side of the last battery in the holder.

These are your reference values.

(2) Test the voltage at the plug of the AOR charger and the RS replacement charger. Are they comparable to the voltages present at the end of the 12 volt car cord? Does the polarity match those of the car cord?

(3) Repeat (1) but use the AC adapter instead; how do those values compare to the 12V car cord?

(4) If the AC adapter is giving the same voltage as the 12V power supply under no-load conditions, what is the voltage at the jack of the AR1000 under load? Perhaps the AR1000 charges it's batteries once the power is conditioned via an internal voltage regulator and there's something wrong with the regulator (I speculate the 12V PS gives enough current to compensate for any regulator problem, whereas the AC adapter has insufficient juice.). Unfortunately, I don't have the schematic handy here...

Back in April I was tracking a TWA plane my wife was on from Lambert St. Louis on its way to LA. I tracked it from the tower, followed the pass off to departure control, and then about 20 minutes later the pass off to Kansas City Center (which controls a bunch of airspace in the midwest.) I dialed in the KC Center freq when I heard departure tell her plane to go to it, and I could pick up planes talking to KC, but nothing from KC itself, which didn't surprise me due to the range.

However, one of the planes that I heard talk to Kansas City Center several times on my drive home identified itself as 'Speedbird' I forget the number, but it was something like 'Speedbird 281'. Most undeniably a British accent, too.

I was also under the impression that the British Airways only used the 'Speedbird' callsign for the Concorde planes, and since I thought that they only flew into JFK in New York I couldn't understand why they'd be talking to KC Center.

Perhaps they do use the callsign for other planes besides the Concorde.

We install communications radios in all sorts of vehicles, some noisy
some not so noisy...

An extension speaker strategically situated will work wonders. Many
cars have a roof lining that is releasable by pulling down the weather
seal by the DRIVERS door. In the curvature between the top of the door
and the roof, there is often just enough space to slide in a small
elliptical speaker in this spot, leading the wires along the
weatherseal.

This way you can get a speaker within a few inches of your ear. When
it is in this position, you can have a broadcast radio on and have the
windows down and still hear everything out of the extension speaker
WITHOUT it being loud.

Failing that, an extension speake POINTING at you will improve
matters. It is amazing how many mobile radios have their speaker
pointing at you feet!

Could someone explain spread spectrum and packet radio communications. I need to have a general understanding of how each works, in what situations they would be used, pros and cons, limitations, better/worse options. We have a need to design a large (Northern llinois) data/communications network able to control/poll Remote Terminal Units(mostly for switches) as near real time as possible. If possible a list of vendors of products/services would be nice.

Depends if your talking nominal or max. For the LTI 20/20 it's supposed
to be used under 1000 ft but can measure out to 2000. The Kustom Signals
Pro Laser II is probably farther. Theres also the LTI Marksman which just
a modified 20/20. Both LTI guns are pretty miserable devices but the
ProLaser is pretty damn good.

Go to:
http://www.motorists.com
lot's of good laser and radar stuff there.

They moved to an 800 Hz countywide trunking system. The list of freqs is too long to post, but the latest POLICE CALL (Radio Shack) and FREQUENCY ALMANAC (U.S Scanner Pubs, PO Box 14923, Portland, OR 97214) both have them. Eastside freqs are listed under Eastside Public Safety. Even if you are only interested in Seattle, there is quite a bit of overlap.

Most of the eastside depts (Bellevue, Redmond, etc) have moved over also.

Good luck

I've been using an Icom R-100. Heighth and depth are pretty good, but
it's a bit narrow (I used some report cover material to fill the hole.)

It's a pretty good radio, but there are some significant problems in
terms of banking. You pretty much have to select or non-select each
freq each time you want to change. They also wipe the entire 800 Mz
band in order to get cell phones out--mine is from before the ban. If
you go to areas that ban mobile scanning, it will be a real hassle to
take it out and put it back in (or you can take a chance).

But I have to agree the pickings are few, and current dashes do not
lend themselves to under-dash installation. I would think that a
scanner that would fit in the dash would be a great seller in those
areas where mobile scanning is legal.

: I want to get the most secure and inexpensive cordless phone out
: there. Preferably under $125. What I mean by secure is that people can't
: listen in or make phone calls off of my line.

The ones with decent security (i.e. digital or spread spectrum) are going to start in the $200-250 and up price range. The ones with frequency inversion scrambling, you might find in your price range. Frequency inversion can be descrambled with a fairly simple device. But I feel it will help quite a lot because most scanner users will just pick an easier target to listen in on, there's no shortage of unscrambled phones.

All cordless phones sold today are quite good in protecting you from having calls placed from your line.

Does anybody have any information at all on the Government Radio
Network.
It is being intoroduced to our Volunteer FireFighter Organisations at a
rate of knots and very few of us know anything about it other than we
now have scanners that will no longer pick up what goes on. As the
callout Officers for our local Brigade we like to keep abreast of
things as they occur, when our members are at an incident.
Any help at all would be appreciated, we only have a week (and only
found out today) until we lose our current VHF/UHF system.

I just bought one of these today at my local radio shack outlet store (Saratoga and Stevens Creek in San Jose, CA). They were closing these out at $174.95. My purpose for buying this was to have decent (and cheap) scanner with a large speaker next to my computer (Now I can put my handhelds back in my vehicle). I discovered (not that I would listen to this stuff with any intent to do so) that it has very clear images at 21. 6 Mhz above the cellular frequencies. This apparently allows you to get via images the cellular frequencies from approximately 872.5 Mhz to 894 Mhz at 894 Mhz to 916 Mhz on the unit. After my purchase the store had 13 left (for those of you who actually INTEND to listen to cellular).

Most importantly, does anyone know of any modifications or test modes for this scanner?

Would the Motorola MTS-2000 handheld come under this description? i.e., 900MHz
trunked? It had "FLASHport" printed on it, 10 channels, an LCD display and a
self-test on start up.

Current Shuttle SAREX and general ham radio contacts are downlinked on
145.550 MHz. Uplinks are 145.91, .93, .95, .97 and .99 You won't hear
an uplink unless you are near the transmitter. Check the GARC (Goddard
Amateur Radio Club) site. I think it's garc.gsfc.nasa.gov or hunt
through other NASA web sites to find a link.

>- SCOTT

Whilst this will seem to work, it does a couple of naty things -

1) You can overdrive the speaker on small radios far too easily. This
overdriving will damage the speaker and you will then have to suffer
the cost of a replacement. Reducing the resistor is going to make it
easier to over drive the speaker.

2) the designers of the circuits go to great pains to get the
component values correct. they have several parameters to look at. One
of them is "output impedance" Don't worry what that is or means other
to take note that changing the resistance alters the output impedance
of the discriminator stages and upsets the input impedance of the
audio amplifier. This in turn can cause reduced performance and audio
quality.

It will also invalidate any warrantee you may have on the radio.

Instead, use either a mobile radio "extension" speaker OR an outboard
amplifier.

Like - er - I heard of someone trying to dry a wet hampster in a
microwave!.....

It is off subject but what the hell - this next bit IS true..

My great grandmother lived in a very old house. The oven was built
into the fire place. When she needed to cook, she shut the oven door
and lit the fire. (As a rule the oven door was always left open.)

Her cat used to jump in at night and sleep in the oven (Ugh!)

Anyway, one day Great Grandma got up early one day, shut the door and
light the fire. She went to do the shopping. When she got home there
was a smell of cooking in the house - she forgot check that the oven
was empty and had cooked the poor moggy!!!!

True - honest!

Be careful what version of tropez you buy. The chearper ones do not say they
are digital on the box. The more expensive ones still do. It could be
the new cheaper ones are just 900mhz.

I have an older one that is digital and I like it, except the handset volume
could have a bit more at the high end...my hearing inst what it used to be.

> The 7100 is available from Canada and Europe. The new 7200 is not
> available in Europe... we'll have to see where it will be
> available from.

The MVT-7200 was originally destined for the Japanese home market but was available with full coverage here in the UK/Europe from around September of last year until early 1996 but is currently not being imported due it not being put through for CE approval - No CE approval means that it cannot be sold *within* European Community (EC) member countries. It can still be exported to Non EC member countries should dealers have any stocks or choose to import it from Japan.

It is still available in Japan although with some frequencies "blocked" out. How long it will remain available I don't know.

The same has applied to the AR8000 - stocks have been limited in recent months and those that have been available have not (shouldn't have) been sold within EC Countries, only export outside (although if they were imported into the EC prior to 1/1/96 thats OK and they can/could still be sold !)

A new internally modified AR8000 that complies with CE regulations will be available soon.

I paid $150 for mine at a pawn shop several months ago and consider it a good buy for the money. It scans rather slow even on high speed, but it does have excellent selectivity and the 800mhz mod is very easy to do. I haven't noticed any problems with the "Power Saver" circuit cutting off transmissions.

How do you modify this scanner to enable the backlight to be turned off? It's bothersome at night. I've looked at about everything to try to figure it out. Vol I of Bill Cheek's scanner mod book didn't have it in there. Any scanner guru's out here?
Thanks, Art

Personally, I've found using the CD-Cassette adaptor to be superb.

You do of course need a cassette player in the car :-)

The one I have has a "curly" cord so is really tidy in the car.

I know Tandy/Radio Shack sell them, but they can be bought a lot cheaper
if you shop around :-))

Best of luck.

The best I've found is the "out of ear" type used by the police here in the UK.

Don't know if it's available outwith the UK but we can get a "clone", rather than the actual police model, which works fine.

I once spent a day at an airshow with an "in ear" type and have to say my ear was feeling pretty sore. Also I couldn't hear when someone tried to talk to me.

I bought the above type , which is really a very small speaker suspended in an ear loop harness. This is better than it sounds :-)

Reception was much better, and no earache. I could also hear when others spoke.

I wouldn't swap it for anything.

Hope this helps.

Regards,

Dougie.

>been keeping up - has aor upgraded the 8000 to support the scout?

The other way around actually. Optoelectronics have upgraded the Scout
to enable it to send commands in either CI-V (Icom) format or AR8000
format (also works on the AR2700). No interface is required. The Scout
connects directly to the AR8000 and works like a charm.

Source record: 231053

CHRIS,
I'd say: go for it. I've seen a few for sale in this
newsgroup, and with some extras for the "new" price.

Areas to check specific to ar8000:

http://www.demon.co.uk./aor/javiation
http://www.crl.com/~vhealey/ar8000.homepage.html
http://www.mich.comm/~eddy/works/

I used a Bearcat200xlt several years as my first scanner.
Out of the box, I was impressed at its flexibility &
complexity, but because of that, I wasn't exactly using
it to its potential on the way home from UPS pickup. On the
other hand, the former is its strength. There is nothing i
can conceive of that this radio can't do with the right
settings. I'm just now getting into using Scancat software
to run it (however it's not often i'm willing to leave this
radio at home connected to the computer, so i'm soon going to
have it running off of my HP200 palmtop in the car using car's
antenna).

Be aware, it's computer controllable, which the others are
not. However on the downside, it's not built like a tank like
the bearcats were. The large lcddisplay on my unit came with
intermittent problems with the last 3 characters. The case
isn't as solid-feeling as a bearcat or Yupiteru(which is better
at shortwave, i hear).

The translucent(backlit) keys' lettering ON the keys will
rub off some SOON much like bearcat keys did only after years
of no case in/out of my pocket. You'll avoid this if you buy
the case to protect the unit($25). Also, the Scout(r) ($400
@Dayton) from Optoelectronics works well with the unit, almost
instantly tuning the radio to the "hit" (requires adapter cable
sold separately for $20-30; think Scancat also sells this for
$12-15).

73s
will
or at least put some clear oil-change-style plastic to protect
the display from scratches.
three characters on the top row.

Well, you could use about any shortwave rcvr that will do
sideband. I personally have two that will work. One is a Radio Shack
DX440, the better one is their relatively new DX394. With the
DX394 I can hear comms on 11175 all the way from Hickam field in
Hawaii to Acension Island and about everything inbetween. A lot of
people get bent out of shape about Radio Shack stuff, but with the
DX394 I am impressed. For the money, it (mine, at least) is not
a bad receiver.

Secret to good reception: a GOOD antenna. What works for
ME? I have a long piece of wire (it is the stranded antenna wire that
Radio Shack sells, but nealry any sort of wire will work. I usually
suggest stranded because it tends to last longer with more flexibility
before breaking) that is stapled the length of the inside of my attic.
That's probably a good 40 to 50 feet. I tap off that with a hunk of
coax (using the center conductor) and take that down to the radio.
The braid of the coax gets grounded down on the radio end. Not
fancy, but seems quite effective. An *outside* antenna would
be even better, but I rent - which makes that a bit of a problem.
Also gotta remember to disconnect before thunderstorms or your radio
can get reduced to molten crud......

BTW, there are LOTs of other frequencies in the HF bands that
military uses. If you subtract out spectrum areas that are allocated
to other services, you are left with a lot of RF spectrum, and in those
spaces you could find military stuff quite easily.

I have also noted that they may sometimes even dip into a
shortwave broadcast band.....which means that it isn't impossible
to find them just about anywhere.

If you have a reciever that will do the AM broadcast band
(the US version of it, that is) and can tune BETWEEN the FCC allocated
"channels" you can find some unusual signals lurking there now and then.

But if you want guaranteed listening, 11175 is a good bet.
The comms are USB, BTW. (Upper Sideband, for the non-radio types)
I won't say that you'll necessarily hear anything real "juicy" there.
Most of it seems to be fairly routine stuff, and sent in the "clear",
unencoded and unencrypted. You will, though, hear some comms get

"handed off" to other HF frequencies. Add those to your occasional "listen list" and you can start getting some pretty interesting stuff. You'll also hear references to UHF frequencies to be used closer in to specific bases. If you happen to live close to that base, and own a scanner that will do the 225 to 430 MHz range, sometimes those frequencies will also be "interesting".

Duane

From: rats@ih4mp736.ih.att.com
Message-ID: <4qp5sh$dju@ssbunews.ih.lucent.com>
Source record: 231060

|My AOR 1000 won't chage from an ac adaptor (tried the original, and a
|RS replacement).
|However, it charges just fine from the 12V car cord. Have been
|charging it from a 12V power supply with the car cord in the house.
|Replaced the batteries, so that's not the issue. Anyone got any ideas
|why the AC adaptor will not work (again, not a bad adaptor. tried
|another!)
|(4) If the AC adapter is giving the same voltage as the 12V power
|supply under no-load conditions, what is the voltage at the jack
|of the AR1000 under load? Perhaps the AR1000 charges it's batteries
|once the power is conditioned via an internal voltage regulator
|and there's something wrong with the regulator (I speculate the 12V
|PS gives enough current to compensate for any regulator problem,
|whereas the AC adapter has insufficient juice.). Unfortunately, I
|don't have the schematic handy here...

I checked the schematic diagram of the AR-1000, and it indeed DOES
condition it's power through a voltage regulator before applying
power to the Nicads.

The flow is as follows:

The center pin of the recharging jack goes to the cathode side
of diode D201 (UBP164) and out the anode side (+); this is apparently
used to prevent reverse polarity from being applied to the innerds
of the scanner. A capacitor, C200, a 22mfd capacitor, goes from
the anode of D201 to ground; the anode also feeds the input of
a three terminal voltage regulator, IC200 (TA7806S). The reference
lead (?) of the regulator IC is grounded. The output lead of the
regulator (I assume 6V Positive) then feeds capacitor C201, a 100mfd
capacitor which is grounded on the other side. The output of the
regulator IC also feeds into diode D200 (HRP-22) on the cathode
side (-); I assume the diode is there to prevent power from being
dissipated by the regulator from the battery. The output of D200
then feeds into R201, a 2.7 ohm resistor. The other side of the
resistor then feeds a 1000 picofarad shunt capacitor to ground,
and also to the POSITIVE side of the 4.8V NiCad battery pack.

Perhaps someone can give some insight in what the possible failure
modes might be with this circuit... You could use the ohmeter
to see if the diodes have gone bad. My bet is that the voltage
regulator has gone south, but I'm not a repair tech...

What are the test modes on the Radio Shack Pro-51?
What do these test modes accomplish?
What can you do in these test modes?
Once you're in the test modes, can you get back to normal scanning?
And if so how?

Hi all

I'm thinking of buying a scanner, by I really feel quite confused about which one I should buy. I've heard a lot of good things about the AOR AR8000 but I think it's quite expensive. Is it really worth all that money ?

I've also thought about buying the Uniden UBC-3000XLT. Is there anyone who has any experiences (good or bad) with this scanner. It's a lot cheaper than the AR8000 and in fact I think it looks very much like the AR8000. Of course you can't expect as good sensitivity and facilities as with the AR8000 and all that, but is it OK to buy ? Or should you buy something more expensive and thereby get better quality and probably get less problems ?

And just a final question:

Where is it best to order a scanner:
At for instance Javiation (I've looked at their impressive homepage), or is it cheaper to by it elsewhere. Since I live in Denmark, I'll have to order it by mail and don't know if it would be cheaper to order it from Germany (If you can buy scanners in Germany at all ?). In Denmark it wont be legal to use a scanner until 1/7 1996 because of new laws. I don't know if it's legal to use scanners in Germany ?

Thanks in advance

Claus.

While I'm sure the statement below is true to an
extent, the true digital phones are as secure as you
can get. It is nearly impossible to pick up my AT&T
9100 on a scanner. What you do receive, when you can lock
on, is a satisfying sssssss. I don't know what form of digital
encryption is used, (if any) however it is beyond me to decode.
I feel fairly secure using this phone. If someone has a method
for decoding it, I would sure like to know about it. ;)

I came from the other direction:
'had an Opto R10 (still THE best SINGLE item to carry around
with you, especially when traveling & you don't care what
the frequency is, just want to be "aware"),
THEN bought the aor8000, THEN Scout this year at Dayton.

The flexibility of 8000/Scout as separate units is wonderful:
can use the Scout in my pocket for "Scout"ing around, or use
to reaction tune. Admittedly, I delayed the Scout purchase
since had the R10 & still do think having both units on your
belt is sort of cumbersome & may i say, seemingly oveerkill &
silly. Maybe in your car, that's another thing.

YOU DON'T NEED TO MODIFY THE AOR8000! Now Opto will sell you
($20-30option) the flat data cable & new battery cover with
cable opening built in. Scancat I think also sells such an
adapter for like $12 (see www.scancat.com).
No holes drilled, no extra jacks needed. Of course, *MAYBE*
this no-holes adapter is a disadvantage ONLY WHEN you also
might want to computer control it, but don't think that's
possible: it's either one or the other.

Very enjoyable, I agree! Anyone else had fun with this combo?
How about anyone getting aor8000 to run off of a palmtop like
HP200lx??

73s,
will p

I will second that motion. I had not considered "variable" bank size but I have long wished that my 200+ channel scanners were divided up into banks of ten channels each. I will have to visit the web site and if they have feed back let them know that I like the idea also. Like you I also have my PRO-43 / PRO-2021 / BC-200 / BC-760 arranged such that I can turn service, department or geographic area on or off with the push of a button. I would also keep duplicate frequencies in multiple banks but made into different groups. If I had smaller or variable bank size I would make use of 400 - 500 channels. I could keep banks programmed for areas that I travel to only a few times a year and that type of thing.

And while we are wishing how about BC-300/PRO-43 class scanner with a PL decoder built in that would let you assign PL tones per channel. And either slide off or twist off battery packs (like the BC-200) or at least charger contacts brought out the bottom of the radio to make with a desk top / mobile drop in charger. I have a friend who works in a machine shop and I have thought about getting him to make me an adaptor out of plexiglas that would let me use my Icom 3AT batteries on the BC-200. Just a thought.

You have a very good question. I, too, would appreciate hearing anything
further on this. I know, also, of regular commercial users that have
retained old frequencies when they moved up to 800, trunking, etc. I have
monitored some of these old frequencies for months (literally) and there is no
use whatsoever.

I would assume that the earphones worn by the secret service and federal marshals fit all of your requirements.
They have a tightly coiled wire running up to them from under the shirt collar. I see them all the time, so I can't imagine that these users would put up with something bad.
Does anyone have any specs on these?
Who makes them?
Where can we get them?
cheers

The majority of the users that move to new frequencies especially large
gov't agencies tend to make a gradual transition and during such time
continue to maintain both the old and the new - eventually the old gets
to where it is never used anymore. They generally continue to hold the
license until it expires and sometimes beyond that - depends on who
handles their licensing renewals. But even after they no longer have
the old frequency licensed many of them are never used by anyone else.
For example look at the old 30-50 mhz. In my area, law enforcement
began abandoning those frequencies in the 1970s. By 1980 they were
totally abandoned by law enforcement in Texas. However, the FCC still
classes them as police frequencies. Law enforcement may still use them
in some parts of the country, but not in Texas. In Texas they are not
used by anyone -you could monitor them for a solid year and never hear
anything. I suspect that as agencies abandon the VHF band and move up
to the 800 mhz. trunked systems, at the urging of Uncle Sam that we will
see much of the same thing occur with the VHF frequencies. It seems
like a waste that they don't reassign those old unused frequencies to

the business, industrial, etc. users. Just my two cents worth.

Hmmm....I do that on a bike. FDNY knows me out here already. Mostly,
they don't mind as long as I stay out of the way and send them some
prints. In B&W, the cost is negligable to stay on their good sides.

> Ultrix@aimnet.com

When you removed the tree you totally blocked your scanner's ability to
recieve 145.550 on 145.585 ;-)

This shuttle mission is using 145.550 for the downlink frequency...the
removed tree should help your reception.

Hello !

Im looking for freqs for the Swedish airshow TEAM60. I know that they have been to several european countries and someone must have picked up their freq.

Am also interested in info on Russian satellite freqs. Do anyone know if there is something similar to FLTSATCOM above Russia ??

They don't make them. What you can do is get one of those "cassettes"
from Sony, they look like a tape but you put them in your cassette player
and a wire comes out of it, you can plug it in your scanner.

Also, Uniden makes a scanner which is about the size of a radar detector,
but it only scans for freqs used by state police. It is used mostly to
warn that cops are around on long-distance car trips.

Would you please help me by the following:
I have a scanner (Yaesu) which I am using in my car. Its power is approximatelly 4-5 watt and I want to work with 30-50 watt, So I'm looking for amplifier to that power.
It has to work in a car with 12VDC.
My most using range of frequencies is 168.000 - 172.000 (VHF).
Please advice me:
1. Where I can buy such device, in USA or (specially) in France.
2. What type is recomended.
3. What is the price (more or less).
I would appriciate any answer.
Thanks,
Boaz Entin

>Were do I find them??

>Thanks for the help.

Because there are "So Many!" of them ... your best bet is
to start searching with your scanner, start at 820MHz and
go up to 900MHz. You'll be surprized.

On the other hand, if you need specific frequencies, you
can check out your nearest Radio Shack, they carry some
interesting books.

I am in Ottawa, Ontario .. and here we have a book called
the Harteq scanner book which carries most Cell frequencies
by number.

Hope this helps,

Well on that note - no phone (available to consumers) is secure.

There are cordless phones that are secure enough that they can be used with as much confidence as a regular telephone.

For all of you who keep crying otherwise - the amount of effort and/or expense it takes to monitor a conversation on a newer digital phone makes physically tapping a phone line a far easier and effective option.

I am willing to bet that more people have had regular (and cordless) phone calls casually monitored without the use of radio equipment.

Most people say that the push to move to 800 MHz, and to 800 MHz trunked systems is due to spectrum overcrowding. Well, the spectrum IS overcrowded. No doubt about that.

I have noticed however, that many agencies seem to keep their old VHF/UHF licenses when they move up to 800 MHz. It seems to me that by doing this, they do not free up any VHF/UHF frequencies. Thus, they occupy MORE freuquencies than they did before, and the spectrum becomes even more crowded.

Have I just seen a few isolated cases of frequency hoarding, or is this a common practice? Does anyone know of any instances in which the vacated VHF/UHF frequencies were actually turned over to other agencies?

BA has used SPEEDBIRD for all flights since the days of props. They used
that call when they were BOAC (British Overseas Airways Corporation). When
they first got jets they used SPEEDBIRD JET until all the props were retired.

Are you sure you have not got your SPEEDBIRDS and SKYBIRDS mixed up? I monitor
11175 and related freqs regularly and have never heard a Speedbird on there.

By the way - Brunswick is in Maine.

Source record: 231137

Yes there is a mod for this. Find the ceramic resonator (a little blue chip) on the main board behind the front panel and replace it with a 3-4 mhz. crystal. The original resonator is about 1.7 mhz. so by replacing it with a 3.4 mhz. resonator you will double the speed. I replaced mine with a 5 mhz. but that has proven to be a little too fast for scanning some freqs. (it will scan so fast it wont stop on a active freq.) So I would recomend a 3.4 mhz. or so. You can special order the crystal from R.S.

> that they only flew into JFK in New York I couldn't understand why
> they'd be talking to KC Center.
>
> Perhaps they do use the callsign for other planes besides the Concorde.

As others have said the callsign "Speedbird" goes back quite some time and
was used by BOAC prior to its merger with BEA way back when to become
British Airways (Doesn't the Speedbird logo go back to Imperial Airways ?).
Since then British Airways have used Speedbird followed by the flight number
as their callsign.

BA282 LAX-LHR Flight would be Speedbird 282
BA322 LHR-Paris CDG would be Speedbird 322

Concorde flights are just the same but quite often with "Concorde" put
in the middle:
BA001 LHR-JFK would be Speedbird 001 or Speedbird Concorde 001
The only Scheduled Concorde flights are BA001, 002, 003 & 004 with Air
Frances' scheduled flights being AF001 & AF002

Concorde is often heard on special Charter or "pleasure" flights (Something
like $1000 for a 2 hour supersonic flight over the North Sea) again
"Speedbird Concorde" will probably be used with a 4 digit flight number.

I have mnetioned this before, but Wally world sells a device, the
"Soundfeeder", that is really an FM transmiter and a dc "reducer"in one
package. The "power supply" will give you 3/4.5,6, or 9V (just right
for a Pro34). The transmiter is fairly clean. It did not add any
noticable birdies to the freqs I monitor (some day I plan to do a search
to see if there are any spurs). An advantage of this unit over a
cassette "feeder" is not all cars have a cassette deck. This plus the
motor in your cassette deck is runing the entire time you are listening.
Wally world sell these gizmos for about $20.00. Another use is when my
wife gets tired of the scanner, we can feed her portable CD(like they
intended) through the car radio. A true win win situation.
Just another option. (of course if yoiu are really serious you could
just add another input to your radio, I know I have intended to do that,
for about 20 years, just never got around to it <G>)

The only problem with "RED BOXING" is that you have to find a REAL old
payphone for it to work. Oh, also, if you get a voice operator and she
tells you to insert money? Don't bother. They can tell if your boxing
now. It was fun to use back in the 80's but it won't work with the new
Electronic Switching Systems (ESS). If your still interested in phone
technology, search out a newsgroup or IRC channel called 2600 (2600Hz
used to be the tone operators used to open a trunk line before
Electronic Switching took over.)

A little correction here. It is also on the 21st as well as 20th and the location is the Dayton International Airport not Wright Patterson.

>Thanks, Art

The backlight of the Pro-2005 is driven by an AC voltage derived from a transistor oscillator driving a high-frequency transformer.

The DIMMER button on the front panel of the 2005 switches either a 47 ohm (bright) or a 150 ohm (dim) in series with the DC supply voltage fed to this transistor oscillator.

You could make the DIM position an OFF position by lifting one side of the 150 ohm resistor, which is R504 in the CPU section of the scanner (the board across the front panel).

Outside of this description, you might have to get the service manual in order to find its exact location.

I think you mean 30kHz steps!

This step increment is enabled as the default when the scanner is
modified to unlock this frequency band, and shows up in the display as
well.

If you don't see it for some reason, hit the front-panel RESET button
to restore the default search increment when in this band.

My Radio Shack cordless is as secure as a corded phone. It is a digital spread spectrum 900 Mhz cordless. $279.99 though. I got it on sale for $229.99 though. It spreads the digital encryption over 100 channel spectrum and my Pro-2006 can't even get a lock on it usually, and when it does there is only silence as it is only picking up the center channel. It is definately as secure as a cord phone unless you have a a fortune to spend on equipment and are a govt. agent. i think an actual line tap would be MUCH easier. And talk about range!!!!!!

>mhz range it only does 5-12.5-or50mhz steps there thanks..

When in that range and searching for active cellular frequencies
press the 'reset' button and the step will change to 30khz

if you press "step" at any time it will cycle through all the
other ones such as 5, 10, 12.5, 25 etc. and skip the 30khz one.

Again you must press reset in the front key pad..

have fun...

Hi David just a suggestion try a subject headings of something like

"Frequencies for Hilton Head Island WANTED"

It makes it easier to spot and you do not have to load the message to know what "frequencies" is!! In you case a request for some in a specific area.

I found it worked better for me in the past.

Good luck, sorry I don't have anything for the U.S.A....opps, Is that where it is?

David Savage <dsavage@greenapple.com> wrote:

I have a difference of opinion. St Louis uses a trunked system and I use the delay as sometimes I find I will lose the rest of the transmission due to the limitations of rubber ducky antennas. I use my priority for the fire dept. If there is really something hot I can quickly take off the priority feature. I'm trying something new. I have the Optoscan OS535 computer interface and have one scanner programed according to the amount of hits each frequency has, and then programing them in decending order. I have heard that one should program the scanner in reverse order anyway/

St Louis also has a trunked system for the police. I do use the delay as I have found that if I don't I can lose some of the conversation due to limitation of "rubber ducky antennas". I use the priority for the fire dispatch. If something really "hot" happens I can quickly take this off. However I am trying something new. I have the Optoelectronics OS535 connected to my Pro-2035 and am keeping track of the number of hit each frequency receives. I have programed one scanner with these frequencies with them in decending order with the highest amount of activity first.

In place of 'scanner patrol', you might consider tracking down one of your local police officers and find out if your city allows civilian riders in the patrol cars. I have done this in both California (LASO) and in Texas. It sure beats 'scanner patrol'!

After that, consider contacting your fire department. I have been a rider in both fire engines and ambulances.

The reason these departments allow (I don't say 'encourage') civilian riders is the theory that informed taxpayers will learn where their tax money is going and will even vote for spending more of it on public safety agencies.

CH>Message-ID: <31CD23C6.699B@pcix.com>
CH>Organization: Plymouth Commercial Internet eXchange

CH>I'm considering the purchase of an AOR 8000 and have a few questions
CH>related to my decision...

CH>Where is the best place to make the purchase? Javiation seems to have a
CH>good reputation, although I'd prefer to find an outlet in the US.

Javiation radio will not be blocked, but will need a new wall wart for
$10.

CH>Can I get a better price in the US?

You will save the "duty" that SOME people are charged.

CH>If I just want to tune the HF bands looking around for interesting CW
CH>signals, how does the AOR 8000 accomplish this? Is there a VFO knob
CH>that I can "spin around", or do I reduce the tuning step to minimum and
CH>hold down the "up arrow"?

You can set High and Low in VFO mode. It will scan this range in any
mode. You can spin the VFO knob, but IT CLICKS, which most people
find annoying when tuning.

CH>What is the minimum tuning step (1 KHz ?) and how do you fine-tune an
CH>SSB of CW signal?

50HZ Steps.

CH>Thanks for your help.

CH>Charlie
CH>Amateur Radio KS1C

Note the AR8K is not a good shortwave radio when compared to a
good portable SW radio such as any of the Sony portables. The
filter is too wide for shortwave. However, it will work
well on a strong signal. I can walk around with a wip antenna in
northern California and easily listen to KAIJ in Texas. Radio
Havana? Forget it!

Kenwood used to make a rcvr mdl RZ-1. I believe it was setup to be used for DIN installations or anything else. The problem was that it was pretty numb on some freqs. It was a nice little unit though. It had alph-numeric display, small package, and would do video without the use of adaptors. I had one for abt a year till I got tired of losing the stations I was trying to listen to. They were also quite expensive. About 600.00 dollars retail.

If I could find another one I'd probably buy it if it was cheap enough.

Good Luck..Don.

Hello Lisa,

The Motorola Trunked system scans the freqs. in reverse order. I don't know about the other trunked systems. If you have a scanner that doesn't automatically sort the freqs then enter them in reverse order. If you have a scanner that sorts the freqs. it doesn't make any difference how you enter them. It will sort them in numerical order from the lowest to the highest freqs. i.e. 1, 2, 3, 4, etc..

I have the Uniden BC9000XLT and have found it to be the best scanner I had yet.

Good Scanning,

The old Kenwood RZ-1 covers 500 kHz to 905 MHz continuous, and is housed in a
DIN form factor. I have one mounted in my truck above my DIN form factor stereo.
Deaf as a two-year old kid, slow scanner, but 99% of the time, if it's out there, I
can pull it in.

Exactly my point. We do not need these kinds of people getting in law
enforcement's way.

Totally a piece of junk!! It does not come with any radar detector
unless you buy that option at a cost of about $300.00. Yes $300.00.
And the scanner is the biggest and ugliest thing I have ever seen.
The audio is the worst in the world too. It has about 500 "birdies"
you must lock out every time you turn it on because it doesn't
remember anything.

I have one, broken now because I plugged it into a wall wart that had
the wrong polarity and the darn thing burned up. They could have put
a 2 cent diode in the thing but then reverse polarity would not harm
it.

I would buy the Bearcat BCT 7 Beartracker if you want preprogramed
frequencies. This is an exceptionally well built scanner and it does
800 too.

My 2 cents.

What I cannot figure out is: if a small hand held cell phone can decode the
signal, why can the decoder/ it's programme etc be incorporated ina
scanner?

The UK Sunday Times, a few months ago reported that someone had given them
a demo, in the 'papers offices, of a machine that was quite capable of
eavesdropping on digital cellular phones. Apparently, you punch in the
cellular phones' no and bingo!! you get to monitor calls to and from that
phone if you are in the same cell.

If that can be done on a cell phone, surely cordless are not safe??

Hi - can anyone help me ?

I'm looking for some software similar to Lotus Sound Recorder (Windows), but
Voice activated, so that I can plug my simple scanner into the microphone port
of my soundcard, turn my squelch up, and not miss anything !!

Does anyone know of any such software - It doesn't have to be complicated, although I suppose a timestamp would help.

ATTENTION SCANNER ENTHUSIASTS!

Are you tired of fumbling through scraps of paper trying to
keep track of all your scanner frequencies?

Have you ever been faced with the inevitable lithium battery
failure in your 1000 channel scanner, only to not be able to
find all the frequencies you once had entered?

Are you saying to yourself "There's gotta be a better way!".

Well, there is! Announcing the release of DAYSCAN! A totally new
concept in frequency database managers! Some of the key features
of Dayscan include:

- Designed with the scanner USER and PROFESSIONAL in mind
- No limit database
- Identifiers for each entry for channel and bank numbers so
that you can keep track of exactly whats in YOUR scanner!
Also, entries include city, state, county, and service
indentifiers! There's even a notes field for each entry
for you to denote special information about a particular
frequency!
- Dynamic user definable search and printing features! Search
or print your database by user channel, bank, frequency, etc.

These are just a few of the key features of Dayscan! Every
scanner enthusiast will surely benefit from this freqeuncy
management system! If you would like to check out Dayscan, simply
call the Dayscan support BBS, at 513-259-6114. Log in as follows:

First Name: DAYSCAN
Last Name : USER
Password : DAYSCAN

You can reach the Dayscan Development Team via the internet at:
DAYSCAN@CPIGEON.COM

Thanks for your interest!

the best frequency to listen to in Louisville is the Avis information channel of 118.150. This frequency will let you know the departure and arriving frequencies for the flights. As far as the freqs for Southwest I don't have them but you be able to ask the pilot or co-pilot, they will usually tell them to you. Several freqs for ailines are.... American Airlines 129.200 and 129.325.. Delta 129.550, 130.100, 131.450... Eastern 130.700, 130.950... United 129.300, 129.500 the tower for SDF is 120.300 ground control is 121.700. Hope these help you and aren't to late. Have a safe flight and let me be the first to welcome you to Derby City... Louisville Ky. Later Doug

Subject: Re: RCMA Scanner Journal

This ought to answer all the questions concerning RCMA!

Roger Cravens
Atlanta, GA

From: Peter Laws
To: plaws
Subject: "SCANNER JOURNAL" suspending publication.
Date: Monday, June 24, 1996 1:42PM

Fellow RCMAers:

Since 1992, I've used this distribution list to forward a membership and staff directory to you, the membership. I hope it's been of some use to you. Not so this time.

I had put this off for a while, as I was busy graduating and, more recently, preparing to move to a new job in Oklahoma (I was planning to become AE for OK, too). I'm sorry I put it off now.

See below for a message from John Clark of the RCMA Board of Directors.

Peter Laws | RCMA Electronic Postmaster
Owner - SCAN-L | AE - Arkansas, _Scanner Journal_
www.uark.edu/~plaws/rcma/scan-l.txt | RCMA: www.uark.edu/~plaws/rcma/

"SCANNER JOURNAL" suspending publication.

The rumor is true. RCMA members should have an official notice in the mail this week.

We seemed to be doing OK on our over the counter sales except for one minor item -- the distributor was not returning any money. They kept saying we were doing OK and sent forms indicating the high percentage of sales and promising money would be upcoming however ...

When the June issue was printed in late May we had a bank balance of $550 and a big $8K printer bill. There was not much else we could do, for we could not rely on "the check is in the mail" anymore.

This week we have received one check (partial payment) and Carol spent Saturday 22 July 96 writing refund checks for the late membership signups. Hopefully we can clear up all of it if we get all of the cash owed us.

Members who sent renewal checks in the last week, their check was not cashed. Since we do not have enough to cover all unexpired memberships we will do so on/and when we get more from the distributor. We also have to cover the printer bill, so this may be a long process.

Our big time came at the end of the CB Craze, and we have had ups and downs with the economy, and whatever electronic gee-whiz is on the market. Since January 95 we have dropped about 20 members per month, and that correlates well with the rise of CD-ROMs and the Internet.

It looks like the window for hobby club periodic publications may be about to close. It was a good 21 years. We were, we think one of the best, but History shows Empires and hobby clubs do not last forever.

John R. Clark

Hello. If you have not already received your postcard from RCMA in reference to RCMA publishing their last issue. Here is a direct quote from the postcard from Jerry Short, Chairman Board of Directors.

"Dear RCMA member,

The last couple of weeks have been spent looking for alterntives to writing this card, but we cannot delay any longer. We are deeply soory to tell you that Radio Communications Monitoring Association, Inc. has published it's last Scanner Journal with the June 1996 issue.

Membership has been declining for some time, and in an effort to revive it--as well as to increase awareness of out hobby--we have begun distribution in bookstores nationwide. While it seems we have been well received, payment has been only partial and months late. The combination of these factors has put in a posistion where financially, we just can't continue.

The cost of this postcard mailing has been underwritten by friends of out hobby and of RCMA in particular. Their support--and yours--has enabled RCMA to collect and distribute information in a way unmatched by any other volunteer scanner organization for more than 20 years. Whether as a longtime member or as a newcomer to scanning, your participation made it work.

We are currently trying to make arrangements to have subscriptions taken over by another publication/format. There are some folks working hard to make this happen; if it is successful, you will be notified. Thank your for your support."

Signed
Jerry Short, Chairman
RCMA Board of Directors

If this golf tournament is being broadcast by ESPN, try searching
between 450 and 451 mHz. They run several frequencies in this range
and are quite fun to listen to and since you get the TV announcers
IFB, you can keep up with all of the action.

Try listening about 1 and 1/2 hours prior to ESPN taking the air to
listen as they prepare the broadcast.

I have taken my scanner to the Tradition, Las Vegas Senior open as
well as the Phoenix and Tucson PGA events and have never been
disappointed.

Like much of what we scanner people use, my favorite earphone was made by modifying an off-the-shelf item.

I recycled a worn-out Sony stereo ear-bud headset (the Fontopia ones) by snipping the dead bud off. Then I just used a stereo<>mono adapter and voila, instant covert headphone.

If you want an ever so slightly more professional look, then use a short piece of heat shrink tubing to bond the adapter to the stereo plug.

The Fontopia earbud is very efficient - it can deliver quite a bit of volume while providing good insulation to outside noise.

Uniden has a 900mhz spread spectrum phone for $149 at Fry's in Southern Calif. As secure as any you can get for that price. Also, you can add a headset for $39 for those looooong calls.

Good luck.

About $600 for the scanner. Yes, it's worth it. 7 A/N characters.

1668. A Note On Buying Electronic Equipment

Newsgroup: rec.radio.scanner
Date: 1996-06-27 00:00:00 UTC
From: Larry Murray <lroger@earthlink.net>
Message-ID: <31D30262.1B4E@earthlink.net>
Source record: 230905

I work part time for a large nationally known electronic retailer, name purposely withheld.
Be cautious when buying from any retail store, because they practice the same philosophys when it comes to sales. Many times I was told to sell equipment as new, when I knew it was not new. For example, I would be told to clean it up, re-package it and not mention anything about being used.
Many returns are re-packaged, cleaned up and sold to the next customer as new, in the hopes that the uniy will stay out of the store this time, or the customer won't bother with the return.
Just, look very closely @ what you buy.

If anyone want's some hints on what to ask or what to look for, let me know.

That is a pretty good start. The name comes from the actual construction:
a disk on top of a cone. Both the disk and cone are made of small rods or
wires radiating from a common point, but if you imagine the space between
the radial wires filled in you would have a disk sitting on top of your
antenna tower, with a cone making a skirt below it. They are very popular
scanner antennas because they have a very broad bandwidth, thus covering
a large part of the spectrum of interest to scanners.

You asked for it!

Here is a base frequency/cell layout chart for BAND B system. Each cell is a transmitter site. In the AMPS (Advanced Mobile Phone Service) system used in the US, cells that are next to each other are never assigned adjacent frequencies and must be separated by 60 MHz. What that means is if you are near the CELL D tower, it is unlikely that you will hear any of the frequencies listed under CELL C or CELL E because they will be 2 cells away. Most of what you will pick up will be at freqs. listed in CELL D and some in CELLs A, B, F and G.

If you search 880.65 MHz thru 889.98 MHz you'll find most freqs. will be in one of the columns in the chart, hence, that is you CELL. Once you know that you'll know what set of frequencies to concentrate on.

Wireline Company Cell Frequencies (BAND B) in MHz.

CELL A	CELL B	CELL C	CELL D	CELL E	CELL F	CELL G
889.89	889.92	889.95	889.98

>there.

That may be the way the system is designed, but having listened to
this very system for almost a year now, I can say that I never have a
problem losing a conversation. If I hear something that begins to
sound interesting, I stop the scan and will hear the entire
conversation. Sometimes lasting 10 minutes or so.

It seems to me that when a "mode" is assigned a frequency, it will
stay there until modes are changed (split on or off, etc.), the system
control freqs change (which happens about every 2 hours I believe), or
the garbage guys start in the morning and the freq allocations change.

Are the cops aware of the fact that when they make an autopatch,
that their entire conversation can and is listened to? I quite often
will hear a guy call his wife on this system and air things that
should never be talked about on a radio. Just surprised that no one
ever mentioned this to them.

> Also the mobile data terminals send packets on these frequencies
>so you have to listen to the rachet noise it makes, which can be quite
>long and bothersome.

That stuff sure is a pain...;'(But it's infrequent which makes it
manageable.

Also, what digital mode do the MDTs use? If it's not classified.

A good book to read on these systems is the "Police Call" book that
you can get from <shudder> Radio Shack for about $10. While it
contains a lot of freqs, it contains explanations on radio, etc and
has a very good section on the new 800Mhz trunked systems.

1687. PRO-46 and 220 MHz Amateur Band

Newsgroup: rec.radio.scanner

From: tomas@halcyon.com
Message-ID: <4qtadr$hlv@news2.halcyon.com>
Source record: 230951

Is there any way to modify the PRO-46 to recv the 220 MHz amateur band? I know of the mod that opens up older versions for the 800 block. I really don't care about that range... but as an Amateur, I sure would like to have coverage of the 220 MHz range.

thanks in advance,

tomas

1690. Mil-air band (225-400 MHz) search advice wanted

Newsgroup: rec.radio.scanner
Date: 1996-06-27 00:00:00 UTC
From: scottr@iquest.net
Message-ID: <Dtn3r9.5K2@iquest.net>
Source record: 230954

Hello everyone,

I'm getting ready to do a comprehensive mil-air band (225-400 MHz) search to see what's active in my area and would like some advice on how long to search a segment. I'm planning on searching a 3 MHz segment at a time and was planning on spending around a week on each segment (18-20 hrs per day). Does anyone have a feel if this is too long or too short of a time? Using a week for a 3 MHz segment will push the total band search time to over a year to complete. I hate to search much over a 3 MHz segment since that takes roughly 2-3 sec on my PRO-2006 and a lot of mil-air transmissions are very short and I want to miss as little as possible.

I'm using a PRO-2006 with a CE-232 and custom CE-232 control software that I've written myself. This software allows me to log the audio along with the frequency hit info (date, time, duration, etc), so I should be able to (hopefully) easily ascertain the frequency's use as well as log callsigns and other bits of info. I plan on leaving the pc on as much as possible, possibly as much as18-20 hours a day during this effort when possible. I need to use it to program as well as listen to the day's catches during the other 4-6 hours. Sounds like it may not be too long until I need a second PC to dedicate to this task :) (hope the wife doesn't read this). We get lots of thunderstorms here in Indiana, and I always unplug everything if there's bad weather in the area, so that will also take away time from the project.

Also, I have a choice of using my Diamond D130 discone or a fringe tv antenna that I've recently put up (on a rotor) for this search. I like the omni-directional characteristics of the discone, but of course there is little or no gain. If I use the tv antenna , I could end up hearing more if the signal happens to be in the main lobe of the antenna, or I could miss something altogether if it is in a null. I know I could perform the band search multiple times with the antenna pointed in a different direction each time, but that'll have to wait until later. So, do I take the chance in using the tv antenna, or go with the discone for the search?

This should be a very interesting project. I also plan on search other areas of the spectrum later on, but I'm really interested in the mil-air stuff, so I thought I'd start with the UHF mil-air band. After that I plan to search the 138-144 MHz band for other good mil-air tactical comms.

Any and all advice is greatly appreciated.

This has been my experience:
Using Microsoft Excel's Query Function (Data import external data)
I opened the Data base file and I exported all the data on
transmitters in my home state into a separate file.
Now I can open that file with numerous data base programs and sort,
search or print to my hearts content. In one case I have the condensed
file renamed as spectrum.dbf. By putting this in a directory with the
files from the CD and running from that directory I get very fast
searches (since only my state exists) using spectrums programs.
I hope to set up a DBASE sheet for sorts using the new data since this
would make it even more effective than the FOXPRO sheets thhat Percom
created!

My suggestion to RCMA and any others who might listen, is to scrap the idea of a printed version and go to an online version.

Imagine an RCMA web site that was password protected. No pay...no password. Easy to administer...easy to update...and VERY inexpensive to maintain.

One of the reasons the scanning hobby is suffering economically, is that many of the hobbyists are so hooked on computers and the Net. Makes sense to me!

>Where is the best place to make the purchase? Javiation seems to have a
>good reputation, although I'd prefer to find an outlet in the US.

I finally took the plunge and purchased the AR8000. I was going to get one from EEB but went with Javiation, after paying Duty I ended up $627 or so lighter. There "free" offer of a socket for use with the Scout and a carry case seemed worth it. I also paid $10 for the crytsal swap to stop the wandering birdies that was talked about not so long ago.

>signals, how does the AOR 8000 accomplish this? Is there a VFO knob
>that I can "spin around", or do I reduce the tuning step to minimum and
>hold down the "up arrow"?

There is a Rotary which you can just "spin round" to tune up or down through the bands and you can select just about any increment step you might want.

WTA.

1699. AR8000, narrow AM filter mod

Newsgroup: rec.radio.scanner

From: klimasewski@fccvde.enet.dec.com
Message-ID: <4qu4lb$ohq@mrnews.mro.dec.com>
Source record: 230963

I have designed a switching scheme that allows the user to select
the stock 12KHz AM filter or the narrow SSB 4.0KHz while still in
the AM mode. I have found this to make a BIG difference when trying
to receive a weak shortwave station next to a very strong one.
The only part required is a switch and some wire.
My mod has no effect on the use of the DS8000 speech inversion accessory.

Send me email if interested.

Sony 2003 direct programming SW radio for sale/trade.
Used very little, in very good shape.
Included are :

1) radio
2) pouch
3) wire antenna on a reel
4) external antenna adapter
5) manual

Accesories are original Sony that came with the unit.
Asking $ 195/offer.
Looking for something half the size or smaller (like Sony SW1)
or a small scanner - need smaller unit for travel.

I must explain futher....
Last October at our Dist. show....
Both Cobra and Astatic were present and the bitch was on....

Why can Copper sell Cobra's and astatics cheaper than we purchase them from the dist.

Answer...when Coppers present inventory is gone....they will not be buying direct any longer.

For those of us that dish out $30,000 - $45,000 for distrs cost on these two lines....
That is the min. purchase from the two above stated sources.

Who should be more pissed......

Many Thanks,
Robert

The main problem with an external amp would be that the phone operates in full duplex. It could be done from a technical point of view but not easily.

The legal problem of course is that it your are prohibited from doing that under FCC rules. And there is good reason for it. If you start pumping 10 or 100 times the power out of your cordless phone system, you will generate interference to other users of those frequencies. You can be almost sure of that - unless you live in the sticks and there is no civilization around you for many miles.

Since the amplifier option would probably be kind of expensive (as well as illegal) - I would just suggest you get a better phone that uses newer technology. My Escort Courier 9600 works several hundred feet from my house. If you need to have phone further away than that, consider a cell phone.

When someone finds the perfect earphone, let me know. I've given up on them because of poor quality sound especially in noisy environments. I almost always rely on RS headphones (#20-210A) for my scanner. They are light, put no pressure on my ears, have air cushions for comfort and also allow ambient sound in. Above all, with a speaker on each ear, provide intelligible sound instead of an overloaded, tinny single-earred speaker. I know that headphones might draw attention if that's an issue, but I keep my scanner out of view and appear to be listening to a walkman.

D> whimpy sonic boom, either, but a big badass double-boom that
D> rattled the windows and window frames and made the birds all fly up
D> out of the ground/trees/underbrush.

You don't get enough real booms, I guess. Even my dogs sleep through
them and these are the dogs who awaken at the sound of a fire truck
siren three miles away.

D> First instinct - look up. Nothing.

Don't look up, look over. By the time the airplane has dragged the
shock cone over you, it's nowhere near overhead.

For example, the Shuttle is something like thirty or forty degrees
from overhead when the boom hits the ground. You can work it out for
a range of Mach numbers.

Of course, since I know where the supersonic corridors here are, I
know where to look. The Shuttle flight path is pretty predictable,
too.

D> I might add, the FAA was real uncooperative. No, they knew
D> nothing about it. They never called me back, either.

They might not, if it's military.

D> Now, I *suppose* that it is possible that all of this stuff
D> had no connection. But I doubt it. I'd sure like to know what the
D> REAL story was, and I say that because the person who said that it
D> was ANG units said that they were op'ing WEST of town. Funny thing
D> about that, the local MOA is to the NORTHEAST. As a general rule,
D> they DON'T do most of their ops outside of the MOA around here. My
D> gut feeling is that somebody screwed up on their cover story. :-)

Well, you can get some very funny effects if there are odd atmospheric
layers because the shocks get reflected and piped away from the
expected footprint. You might also have heard an overenthusiastic ANG
pilot who got a little fast and didn't mention it to the boom control
officer.

Best way to find out if it was the ANG is to complain, but you might
get someone in a lot of trouble. You'll have to decide how much you

really want to know; is it worth someone's career for you to satisfy your curiosity?

Anyway, why would anyone "cover up" a sonic boom? Any supersonic plane can make one and doing so doesn't exactly indicate a plot or secret plane or anything. You already know you've got aircraft capable of creating them in the area.

The other hassle is.... If you decide to search for freqs that will be imported into a scanner program, you must first do the search, check the freqs to make sure they're the ones you want, and then do the search all over again. If you're running off the CDROM this can be quite time consuming, depending on what you're looking for. Anyone buying this product will be better served if they one, have a large enough hard disk to store the CDROM (600 Megs worth!) and a database with which to massage the data. Putting it on the HD speeds up the search. The database facilities that come with the product are very rudimentary. You are quite limited in how you can slice/dice the info.

Source record: 230981

I've been wondering about the phone used by commercial airliners... They apparently use 849-851 for ground station uplinks and 894-896 for aircraft downlinks; they are set off in 6 Khz steps; and they're AM (I think). Problem is, the scanners and scanning programs I'm familiar with, either won't scan in 6 Khz steps or even let you enter a frequency such as 849.6055, which is not divisible by 5.

I guess these phones also are digital, which means you can't hear them if, you managed to tune them. Did I get this right or is there some way to tune these particular freqs?

I'm not talking about the 454-459 Mhz phones that private airlines use...

You COULD do something similar with Microsoft Access, if you have it.

You COULD attach the spectrum.dbf file on the CD (it's PROBABLY Foxpro format) to an Access database on your hard drive as an external table, then write a create-table query (all freqs in your state, for example.)

You could even filter out the freqs that your scanner doesn't pick up at the same time.

The resulting Access table could be queried any number of ways - all emergency services in your county, all business freqs within a three mile radius of your house (http://www.mapquest.com to figure out the latitude/longitude of your house), all remote broadcast freqs in the entire metropolitan area (for all the traffic helicopters, etc), and so on.

What 'system' ??? do you mean the trunked subscriber units ?
If so, please indicate where in the service manuals or relevant
PSB's that make reference to the order in which the radio controller
scans for the system control channel. The system control channel is
subject to change automatically (as everyone is aware of), however
it can also be 'bumped' manually thru a SIMS terminal by authorized
personnel - for system testing/maintenance purposes. I asked several
FTR's and SSC people about this, and no one can confirm that the
radio firmware commands the synthesizers to scan for a control channel
in 'reverse order' .....

I don't
>know about the other trunked systems. If you have a scanner that doesn't

I have the folowing items for sale or trade ONLY to an AR 8000 scanner with or without options.

Kenwood TS-50S HF transceiver, .5 to 30 mhz receive, 3 to 30 Mhz transmit. 100/50/10 watts, am/fm/usb/lsb/cw modes, small and compact and in very good condition. Includes box, manual, mike and mounting bracket. $750 or if you need a base power supply I have the Kenwood PS-430S and will sell both for $850. Price does not include shipping.

Ten Tec Argosy Model 525 transceiver with audio cw filter and calibrator. Radio is in good shape and works QRP like a pro. I have the matching power supply which is in fair condition. Paint is chipped off the front panel but otherwise it works great. No mike or box. Manual included. $400 + shipping.

AOR AR2515 scanner/HF receiver covers 5 to 1500 mhz continuous coverage, am, fm and wfm. Will also do ssb/cw with a Ten Tec BFO kit. Has 64 banks of 32 memories and 16 banks of 2 search memories for a total of 2016. Radio is in good shape. Price is $350 + shipping.

Again, trades for AR8000 and accessories are all I am interested in.

: The only problem with "RED BOXING" is that you have to find a REAL old
: payphone for it to work. Oh, also, if you get a voice operator and she
: tells you to insert money? Don't bother. They can tell if your boxing
: now. It was fun to use back in the 80's but it won't work with the new
: Electronic Switching Systems (ESS). If your still interested in phone
: technology, search out a newsgroup or IRC channel called 2600 (2600Hz
: used to be the tone operators used to open a trunk line before
: Electronic Switching took over.)

: Pa Bell :)

Ok. For starters, you do not have to find a REAL old payphone for it to work.
There are two BASIC requirements. The first requirement that it is a TRUE
Bell Western Electric payphone. The second requirement is that the mic is
not muted during the initial coin collection. Even that requirement can be
by passed, but I won't go into that.

If you have a properly calibrated redbox, the system(hence the operator) cannot
tell the difference between your redbox and the tone generator inside the

payphone.

The 'new' Electronic Switchs have nothing to do with how a payphone call is billed. The ESS's ONLY job is call handling. It does NOT handle coin collection. The system that handles coin collection is called ACTS. The automated Coin Telephone Service is the system that prompts you to insert coins, and 'listens' for the tones. Please do not confuse the signalling used to complete a call with the signalling system in place to handle coin collection.

And just an added note, 2600HZ is still being used to defraud the regional Bell offices, and also long distance companies. The felons(long distance fraud is a felony!) dial 1-800's which terminate in countries using R1 signalling, and dial back into the states.

It's a round antenna with two sets of elements. One set are short and extend
outward horizontally from the center, and the other is longer and extend
downward at an angle from the center. There are usually 8 of each element and
a discone looks a little like this:

```
----o----
/|\
/ | \
/ | \
/ | \
/ | \
```

1729. AR5000 Review

Newsgroup: rec.radio.scanner
Date: 1996-06-27 00:00:00 UTC
From: michael@alexander.terranet.com
Message-ID: <michael-2706961956510001@news.terra.net>
Source record: 230993

A few weeks back, someone asked whether there had been any reviews of the AR5000... I came across one today in a UK magazine called Shortwave Magazine. Despite the name, it often has several articles about scanners (with a UK/European slant naturally). You can find it at large newsstands or bookstores. I picked up my copy at Borders for $5.25. It's also worth reading just to see all of the ads. You see models that are generally not available her; it's also interesting to compare prices.

Best of all, this is one monitoring magazine that doesn't suck up to the advertisers like the popular ones here in the US. The reviewer notes some of the scanner's shortcomings (complexity and awkwardness of some controls, for example), which I think adds credibility to the review and the magazine. You just don't see anything like the same level of objectivity in the mags you find on local newsstands. Worth checking out, even if you don't plan to subscribe...

> Can anyone help me make a beam antenna for my scanner? I need ideas
> on how to support the elements, director, etc, and have the antenna
> vertical rather then horizontal. Frequencies of interest: between 30
> and 50 mhz
>

An old CB beam makes an ideal antenna for lowband VHF by trimming each
of the elements by several inches or more (depending on what part of
30 - 50 MHz you would most often listen to).
Conversly, a 6 meter Ham beam or a normal TV antenna would give
reasonably good RX performance on lowband.
These are a couple of "make it easy on yourself" suggestions.

If you still prefer to make one then you would have to find a source
for aluminum stock and fabricate the boom, elements and a matching
scheme. The means of attaching the elements to the boom has a lot
to do with the matching method that you elect to use. Some allow
direct DC connection to the boom, others require the elements to be
insulated.

If you are really interested in antenna theory and building
them then I might suggest that you pick up a copy of the ARRL Antenna
Handbook. Lots of good info, antenna projects and practical ideas !

But do you have them in stock????

I've been waiting for a few months now to hear
back from Terrance (the guy who makes them) and am still waiting.
Theirs quite a market for them here in Toronto Ontario and it does not
seem to make a difference to him.

Do you have them stocked? HOW MANY CAN I BUY AND WHEN CAN I GET THEM?

I want to do the installations myself. I do not want to ship dozons of
scanners and deal with waiting customers for their return.

This is a crazy way to do business...2 months wait for just a reply!!
At least one that says something different from, I"m on vacation I'll
get back to you soon.

I'm selling my Regency TS-2 Turbo Scan 800 base/mobile scanner. The
scanner has just been peak tuned, and the moto antenna inputs were
changed to BNCs. This scanner works like a charm, has user-definable
banks, 800 Mhz Uncensored. Includes manual, service manual.
$150.00 or best offer shipped to CONUS.
E-Mail if interested

You could use a RF radiation field servey meter that would give you mw/cmsq
The probes used for such meters are so broad banded that you would
have a difficult time determining which frequencies you are measuring.

The only way to get a good feel for the spectrum is with a spectrum analyzer.
You can connect an amplifier to your Yagi if the signals are low level.
You could build a spectrum analizer that would connect up to an o-scope but I
have never seen one that would extend above 1.2 without down conversion.

You would be much better off with a portable spectrum analyzer tektronics makes
a model 492P which retailed for ~ $12K US. Try a rental place or maybe Tucker
will rent/lease one for your measurements. They are on the WWW I don't have
the address handy. Use a search engine.

You would then need to calculate the free space attenuation of the signal level
you recieved and you could determine the approx tx output if you know the
distance from the emitter.

Chris

W>Rumor has it that the RCMA Scanner Journal has ceased operation due to
W>severe financial difficulties. Anybody got any news on this???

Publication of the Scanner Journal has been suspended as of June 20th.
The RCMA itself is still alive and efforts are being made resume
publication of the Scanner Journal. The situation is very much up in the
air as of today, so there isn't any more news. As soon as anything
definite is known, the news will be released.

Go to Radio Shack with the part # of your radio (20-XXX or whatever).
Have the RS guy/gal call national parts and order the "electro
luminescent" for it. They may say they need all the individual part #s,
etc., but they don't...my RS has ordered several for me that way. Last one
I bought was about $12 if my memory is accurate. The EL is a light green
panel that fits behind the LCD screen.

Once you get the electro luminescent, you will need to take the front
panel off and take a bunch of stuff loose. I recommend you get the repair
manual (about $10, but well worth it) at the same time you get the electro
luminescent. Another handy item would be one of Bill Cheek's first 2
scanner mod books. He shows/tells how to take the thing apart. It
requires some soldering and substantial disassembly, so if you are not
sure of your skills, have a friend do it. It really isn't too bad if you
take your time and DON'T PRY OR FORCE any parts on the radio! If you have
problems, send an e-mail to me and I will try to help.

If you took it to RS repair, they would charge you for the EL and about
$50 for labor, so even if you buy both books and the EL, you will probably
come out ahead.

Andy

I recently built a new room in my house which I use as an office. This is also the place where I listen to shortwave and scanner radios.

The problem is that I installed fluourescent lighting in the office and these lights seem to cause interference with my active sw antenna and RS discone (both mounted in attic).

Does anyone have any advice on how to mitigate the interference?

Thanks!

Your lucky to even see the UPS person. They usually deliver while I'm
at home, but unless I hear them, they will drop the package on my
doorstep and leave. I'm pretty sure they don't even knock on the door.
If they do they don't try very hard.

There is a company (Cellular Security Group) that will modify it for about $100.00. What they do is use the attenuator function (you lose that function) to turn on and off a built in down converter that they install. I have not done it myself because cellular is not that important to me, but I did call and ask them how they did it out of curiosity. I found their ad in Popular Communications.

Back in the days when CBs were all the rage, there was a CBer that lived across the street from the church I attended. Rumor has it that he was pushing about a 1000 watts. Anyway, whenever he transmitted he could clearly be heard over the church PA system.

I have also recently heard a CB over my home stereo. It did not last very long and I have not heard it since. I figure it must have been a mobile.

The Best method I've seen (and I hate to add...used) is to rinse the wet device with distilled or de-ionized water. (Check the contact lens section of your local drug store) After all the thing already is wet how can more hurt it? This is to wash away any salts or other conductors off of the pc board. After it is good and rinsed just open it up to let it dry. Or just keep it closed and let it go that much longer. This method has never failed me yet. The only problem is if the unit had power applied you may have already toasted it. But... what do you have to lose? Let me know how it turned out!

1765. Best Interface for AOR 8K??

Newsgroup: rec.radio.scanner
Date: 1996-06-28 00:00:00 UTC
From: dale martin <ndmartin@computek.net>
Message-ID: <31D4C18B.6179@computek.net>

I am planning to use ScanCat Gold with my AOR 8k. What would be the best interface to connect it to my computer. I have heard that there are three: EDCO, AOR, and Opto's.

Which one works the best?

Thanks for your opinions.

I assume you mean the 2042? One thing to check on: I learned the hard way with the otherwise fine 2006 I had. It went to 1300Mhz too, but buried in the owner's manual was the specification that the sensitivity from 1000 Mhz to 1300 Mhz was very poor compared to the sensitivity up to 1000Mhz.

You might want to check this on the 2042, since the catalog says nothing on sensitivity at all. You seem to be specifically interested in the 1300 Mhz aspect, if not, then this may not matter to you. I wanted to listen to the 1296 FM Ham band with my 2006, so I was very dissapointed.

Hope this helps... Dave in Phoenix

=0=

There is no 'shades of grey',no 'grey areas', only black
and white spots, some of which are very small. If you
see grey, you're not getting close enough to what you're
looking at to know it's true nature.

I have dealt with Copper Electronics on 3 occasions, all three were Web-based orders, and I got what I ordered with no problem.

I had heard about Copper and their factory re-furb sales, but in my dealings, I got exactly what I ordered with no problem.

What you HAVE to do when there is a dispute is to keep records, and DOCUMENT each phone call, when it was made, who you talked to, what was discussed, etc.

If you return product, get authorization, send copies of all supporting documentation (do not send originals) with the unit so that there is NO QUESTION as to what has transpired. After all, the person you talk to on the phone is rarely the person who unpacks incoming service equipment!

When you talk to a company rep on the phone, make sure you have your act together. If you can't give names and places to back up your verbal claims, they will naturallyn assume that it is YOU who are trying to pull a fast one on them!

Customers who have their S**T together and send documentation are much more likely to be serviced quickly and get the outcome they desire. Those that play it fast and loose will almost always be disappointed, and spend more time complaining about it on the net than documenting the situation when they had a chance.

It is a little late notice but I was hoping to take my scanner to this weekends Senior Golf at Kings Island, Ohio. Does anybody know the frequencies that will be used, pointers to sites that may have this info, or a list of frequencies used at this type of event.

Any help will be appreciated.

1776. Wierd problem with a pro39

Newsgroup: rec.radio.scanner
Date: 1996-06-28 00:00:00 UTC
From: Tim Andersen <tim@axon.cs.byu.edu>
Message-ID: <4qvfjk$i02@hamblin.math.byu.edu>
Source record: 230923

I just purchased a pro39 which seems to function normally except when doing a direct or limit search. When performing one of these types of searches the scanner will generally (but not always) skip over certain frequencies. It does this even when the squelch is all the way open and the scanner ought to be stopping on every frequency. The frequencies that it skips are always the same ones, and they seem occur across the entire range of the scanner.

However, if it is scanning stored memory channels the scanner works normally (in other words, the radio will stop and monitor the channel when it is supposed), even if the stored channels are ones which it normally seems to be skipping in a direct search.

Does anyone have any ideas on what might be causing this type of problem?

Thanks,

Tim

Sure, no problem.

Truckers often run extra power on their cb radios so they can "get out"
with their signal. When they do this, they use devices called linear
amplifiers which take the four watts from their cb and amplify the
signal...
as much as up to 1000 watts!! (But usually more like 250).

So chances are this is what was going on. And when the signal is
amplified
in that manner, they have a tendency to disrupt phone conversations,
televisions, etc...anything with transistors that can pick up the
signal.

I went into Excel and loaded up spectrum.dbf from cd rom. It only loaded
the first 16k entries. I'm not sure if Excel is designed to hold a
400Meg database. I suspect it is best to let Spectrum do an initial
filtering of the database, such as by state.

They are known as the control channels, and are always "active", though
the data may be idle. Perhaps this file will help. It's a bit old.

ag800.txt
Al Quaglieri
Subj: Air-ground phone freqs

The FCC has issued rules on allocation of the 849-851/894-
895 MHz bands for air-ground radiotelephone service.

The new action, effective September 9, 1991:

1) changes channel spacing from GTE Airfone Inc.'s de
facto standards;

2) orders GTE to make its service available to other
air-ground licensees at non-discriminatory rates;

3) divides each channel block into 6 control channels
(P-1 through P-6) and 29 communications channels
(C-1 through C-29);

4) provides for a communications channel bandwidth of 6
kHz;

5) gives GTE 22 months to modify its current control
channel scheme; during this period, GTE can use
the lower 20 kHz of each channel block, which
includes channels C-1, C-2, and C-3, for control.
GTE then has another 38 months during which it can
only use a 3.2 kHz control channel in channel C-2
of each channel block. After these transition
periods end (September of 1996), GTE must switch
to control channels marked P-1 through P-6 in the
tables below;

6) empowers the FCC to assign exclusively one control channel to each air-ground licensee;

7) limits the ERP of airborne stations to 30 watts; maximum, and that of ground stations to 100 watts maximum;

8) limits the ERP of ground stations to 1 watt when communicating with aircraft on the ground.
.pa
GROUND TO AIR CHANNELS

(NOTE" "GB" in these listings denotes Guard Band, a series of 3 kHz spacings to separate communications channels from control channels)

1792. AR 800 question

Newsgroup: rec.radio.scanner
Date: 1996-06-28 00:00:00 UTC
From: "Marcel A.R. Gersie" <mgersie@euronet.nl>
Message-ID: <31D3A57C.33B1@euronet.nl>
Source record: 230939

Hi,

I'm thinking of replacing my old AR 1500 for a AR 8000.
So I'd like to now the (dis)advantages of the 8000 to the 1500.
Also I've read in this newsgroup about "floating birdies" or something
like that in the 8000, can somebody tell me what that is and what can be
done against it.

Thanks in advance,

Marcel

1794. Re: How Much is a Uniden BC100XLT

Newsgroup: rec.radio.scanner
Date: 1996-06-28 00:00:00 UTC
From: markl9@aol.com
Message-ID: <4r074t$luu@newsbf02.news.aol.com>
Source record: 230941

I had one when they were new and paid about $190 for it way back then.
Now, a used BC100XLT shouldn't be worth more than $50.

1795. REQ. Frequencies for "ROADRUNER Transportion" In St.Paul MN!

Hello!, I was just curious if anyone had the frequencies for "Roadrunner"
it is a local on-call courier service!, and would be interested in
monitoring.
If anyone has these frequencies, or has a fcc book that can look them up
for me i would GREATLY appreciate it :)

Thanks very much!, and "Happy Monitoring"
J.

The display will show 7 characters.
I think it's a great radio but I'm having a hell of a time getting it to
talk with my Macintosh through an Optolinx.

Hi folks!

My daughter, who is 12 years old, and our next door neighbor's daughter who is her classmate, say they want to but a pair of walkie-talkies. I know there are inexpensive walkie-talkies that operate in either the CB range (typically on channel 14, sometime others) or in the 49mhz range (same same as some cordless phones and/or room monitors.

They don't need anything terribly powerful, and to be honest, I wonder how long this interest will last. On the other hand, I don't wnat them to waste their money on junk that won't be any use (or fun) for them.

Should I mind my own business and let them buy "space patrol" walkie-talkies or some such things, or should I try to get them to consider buying something half-decent.

Even the Radio shack catalog offers several options in the $30 range or less. They must be serious, though, cuz I talked them out of doing this some time ago, now the same idea has come back!

Any opinions out there what might work best for them? Anybody have somthing cluttering up the closet to offer that might do the trick?

I'd appreciate any comments or suggestions. Thanks!

- Dave

ag800.txt
Al Quaglieri
Subj: Air-ground phone freqs

The FCC has issued rules on allocation of the 849-851/894-
895 MHz bands for air-ground radiotelephone service.

The new action, effective September 9, 1991:

1) changes channel spacing from GTE Airfone Inc.'s de
facto standards;

2) orders GTE to make its service available to other
air-ground licensees at non-discriminatory rates;

3) divides each channel block into 6 control channels
(P-1 through P-6) and 29 communications channels
(C-1 through C-29);

4) provides for a communications channel bandwidth of 6
kHz;

5) gives GTE 22 months to modify its current control
channel scheme; during this period, GTE can use

the lower 20 kHz of each channel block, which
includes channels C-1, C-2, and C-3, for control.
GTE then has another 38 months during which it can
only use a 3.2 kHz control channel in channel C-2
of each channel block. After these transition
periods end (September of 1996), GTE must switch
to control channels marked P-1 through P-6 in the
tables below;

6) empowers the FCC to assign exclusively one control
channel to each air-ground licensee;

7) limits the ERP of airborne stations to 30 watts;
maximum, and that of ground stations to 100 watts
maximum;

8) limits the ERP of ground stations to 1 watt when
communicating with aircraft on the ground.

MJR>Newsgroups: rec.radio.scanner
MJR>Subject: Panasonic KXT9550 phone scannable?
MJR>Date: Thu, 27 Jun 1996 20:24:09 GMT
MJR>Message-ID: <quioxteDtoE09.F2C@netcom.com>
MJR>Organization: NETCOM On-line Communication Services (408 261-4700 guest)

MJR>I'm in the market for a 900 MHz phone and like the Panasonic KXT9550. I don
MJR>know how secure it is. Can anyone tell me if it is a digital phone or if i
MJR>in any way prevents someone from scanning my calls? Thanks. .

My understanding is the Panasonic phones are simple NFM, not spread
spectrum. Previous posts here indicate the ATT spread spectrum phone
is the best. [I don't remember the number.] It costs around $170
at Costco. I don't think the Vtech phones are spread spectrum anymore. THe
model they sell with "ADL" in it is not spread spectrum. Hope that
helps.

Albany County is within the coverage area of the NF2G Scannist
Pages, located at http://www.frontiernet.net/~dstark/.

1808. TR-720 Airband Transceiver For Sale/ Trade?

Newsgroup: rec.radio.scanner
Date: 1996-06-29 00:00:00 UTC
From: pett@aol.com
Message-ID: <4r2mrr$lju@newsbf02.news.aol.com>
Source record: 230802

I have a mint condition Tr-720 Airband Transciever made by Communication Specialists, that I really have no use for since I don't fly. If I remember correctly it cost close to $900-$1000. It has a leather case , power adaapter/charger, batterypack, it is as new condition, (was used maybe 2 times since new) I have Pro-43, Pro-39, BC200xlt scanners. SO I dont think I need another unless it is some computer interfaced unit with high tech appeal. (kinda bored with the Pro-43,39 stuff) I am open to cash offers, or interesting trades. Be creative and interesting and we can make a deal... Makes an ideal backup radio for your airplane , balloon, sailplane. Covers all 720 COM and 200 NAV Frequencies, FCC Type Acceptance and DOC Certification

Source record: 230804
Cross-posted to: rec.radio.scanner,alt.radio.scanner

>I have had no luck with my AR8000 and scout on the AM bands with direct
>tuning, every other band is OK. I beleive that in the specs it says that
>it does not sense AM transmissions....

In that case I have a bridge you may be interested in buying...

The Scout detects the carrier, not the modulation method and therefore
works equally well on FM and AM.

Where you MAY have a problem is in the fact that it sends a command to
the AR8000 to set its mode to FM. I think it only does that the first
time it sends a freq to the AR8000 though and that it is possible to
simply "force" the AR8000 into AM mode anyway.

In any event, I have used a Scout at airshows with great success.

>Thanks for your opinions.

Now you have heard of four! ;-}

I produce a low cost kit set AR8000/2700 Interface Unit that should
meet your needs.

I sell it as either a DIY kit or as a BUILT and tested unit.

In the kit, I supply ALL the components, strip board, mounting
pillars, solder pins, Diecast box, 2 metres double screened cable AND
the special Flat Ribbon (FFC) to fit the AR8000 (or 2700), together
with full working drawings and very detailed step-by-step assembly
instructions. This is a suitable project for a beginner as long as you
have a fine tipped 25w soldering iron.

Alternatively I will supply it build it up and tested.

It will accept all the software that will run on the AOR CU8232 with
the exception of "cloning" (how many of us own 2 or mor 8000??)

UK pricing:-
DIY kit UKP 25.00
BUILT up ADD UK 15.00
Post and packaging: UKP5.00

For USA & Canada:-
KIT = USD 50.00
BUILT = USD 75.00
Prices include delivery by airmail

Email me for more info
I shall be away this week end so cannot respond until monday or
Tuesday....

PS: Watch out for the new release of "Channel Commander" V2.0 software
for the AR8000 very soon!

1813. Cell Phone Conversion?

Newsgroup: rec.radio.scanner
Date: 1996-06-29 00:00:00 UTC
From: mdonovan@ix.netcom.com
Message-ID: <4r39vp$fku@dfw-ixnews4.ix.netcom.com>
Source record: 230807

What to do with an old cell phone? At times you see them at the swap meets for next to nothing or you change service and get a 'free' phone.

Is there any information around on conversion of these old cell phones to scanning receivers? Would the work be worth the results? Any and all information welcome.

1814. WTB IFR Supplement

Newsgroup: rec.radio.scanner
Date: 1996-06-29 00:00:00 UTC
From: n5off@aol.com
Message-ID: <4r3ano$ppt@newsbf02.news.aol.com>

I see very little talk about it.

I have a BC3000XLT, and love it. But would like a scanner that can
hook up to my computer (not rich enough to afford the AR 8000)

Any opinions are appreciated!

Playstation Monster Secrets is now available

1818. Alpha-paging & Scanner Monitors

Newsgroup: rec.radio.scanner
Date: 1996-06-29 00:00:00 UTC
From: Jim <edisonfd@gramercy.ios.com>
Message-ID: <31D5588D.775D@gramercy.ios.com>
Source record: 230812
Cross-posted to: alt.radio.scanner,rec.radio.scanner

If I might, a moment to introduce ourselves. Breaking News Network is a NYC area alpha-paging media source. We notify our customers instantly of working fires, multiple alarm fires, serious MVA's, haz-mat jobs, noteworthy police incidents including but not limited to riots, police involved shootings and unfortunately when police officers are shot. High speed chases, major crimes and upon resolution, the apprehension.

Our customers are television outlets, all-news radio stations, print media, fire buffs, fire photographers, fire marshalls, firefighters. Police officers, medics and the like.

We cover from upper Virginia, Maryland, DC, Delaware, Eastern Penna, all of New Jersey, NYC, and the surrounding metro area counties and lower CT. To do this involves over a 100 dedicated reporters on our part, as one would assume covering an area with 1/6 the US population. From Hartford south through FDNY, into Newark NJ, Camden NJ, Phila PA, Wilmington DEL, Baltimore, Wash DC, the amount of fire is at times scary. A typical FDNY day consists of approx 10-15 all hands fires and 1-2 multiple alarms. We cover it 24/7.

We also exchange greater alarm fires and newsworthy incidents with notification systems throughout the United States. For example, in the past three days Wed 6/26- Fri 6/28, we paged and sent to our reciprocal groups almost 50 incidents, ranging from a riot in Harlem, Manhattan; a 5th alarm fire in Manhattan, a 3rd alarm fire destroying a church in Staten Island, a 4th alarm fire in an apt bldg in Camden NJ, a 4th alarm fire in Long Island that destroyed a paper goods warehouse and in an effort to be mid-west friendly (pun) a general alarm fire in Western NJ that destroyed a chicken/egg producing facility, killing 380,000+ chickens.

As well as we cover this vast area, it is our goal to not miss a single newsworty incident. And if that means adding people to overlap our existing coverage, we will do so. If any readers of this list find the idea of listening to radio transmissions and alpha-paging compatible, either e-mail above address or call our toll-free phone 888-875-6100 Monday thru Saturday 11AM-6PM. In exchange you would receive a free Motorola advisor alpha pager and some other nice benefits.

Thank you for your patience in reading this, and hope to hear from interested parties.

Additionally, if you are in a distant city, we can make arrangements to assist you in getting our information, or perhaps in establishing a system in your locale. The call is free, the advice free.

Jim

> Alan WanfordRadio Shack Sells a 20db mast mount amp that goes from about 400 to 1495 Mhz for about $29.00. Use that and F59 cable/connectors then you can use cable TV splitters. you'll lose 3db per split but the up front gain will cover it. You can also add a varible attenuator (if your scanner doesn't have one) from Radio Shack to prevent front-end overloading from strong signals.

1829. Re: RCMA Scanner Journal dead???

Newsgroup: rec.radio.scanner
Date: 1996-06-29 00:00:00 UTC
From: mgmercer@halcyon.com
Message-ID: <mgmercer-2906961251330001@blv-pm2-ip15.halcyon.com>
Source record: 230823

It is possible that RCMA could be published on the internet. I think one of the problems, is the readership. I do not know how many of the readers subscribe to online services (what percentage). I believe that most of the editors, on staff do have internet access. Carol Ruth, the Managing Editor of the Scanner Journal, could be online, with a lot of technical assistance, but it was my understanding, she preferred publishing the old way. As a former Public Safety West Editor, for the Scanner Journal, I know from personal contacts with Carol, that she didnn't like to receive anything electronically. She was not comfortable with computers enough.
Cutting costs at RCMA, has laways been a big issue, and I know that the staff, has worked hard to keep costs down. Whether or not, the Scanner Journal resumes publication, in it's present form, is probably only known to Bill Mauldin , Carol Ruth, and the board members. If it were to go online, there would need for some technical type people to come on board, plus, RCMA woud have to determine how they would make enough money to stay in business, by going online. True, there might be more readership. Only time will tell.

Bingo. Yes, most RS salespeople don't know squat about scanners except that they can receive "police, fire, stuff like that". But they don't know specifically. Ask them what the "audio output" is and you'll get a blank stare.

Hey, but we're not here to "flame". That's been done. The radio IS supposed to be a good one, but for a little less money you can get the Uniden BC3000XLT which is a better receiver.

If you have an existing cell phone service, you could clone the old one to
to be the same as your current, active phone. Then it can be used as a back
up or alternate. The only restriction is to not have both turned on at the
same time.

Hi Karen

I have abit of info on the GRN, send me an email and I'll reply with
the information. The problem with the GRN being Trunking is that there
is no way for a scanner to follow the data commands, YET. But I can give
you the GRN sites around you location if you let me know...

A lot of the older test equipment was built and housed
in wooden cabinets or cases. I am interested in securing a
variety of these wooden cases. Some of them are copper
lined. They were used on older signal generators, test
units, amp meters, etc. Most have a smoothly sanded
outside with some type of finish applied to the wood.
Not interested in anything that has been painted.

Let me know what you have.

Bryan W5KFT

If you want, keep the internal goodies, I just want the
cabinet/case

From the FAF - Frequently Asked Frequencies
on ftp://oak.oakland.edu
as /pub/hamradio/docs/misc/scanner.faf

FRS - Family Radio Service [95.627]

Ch	Freq	Ch	Freq
1	462.5625	8	467.5625
2	462.5875	9	467.5875
3	462.6125	10	467.6125
4	462.6375	11	467.6375
5	462.6625	12	467.6625
6	462.6875	13	467.6875
7	462.7125	14	467.7125

The FRS was adopted on 10 May 96 and will be authorized
by July 96. It uses FM with a peak deviation of +/- 2.5 kHz.
Maximum power is 0.5w.
Channels 1 - 7 are shared with GMRS.

CRB Research books, 1-800-656-0056, has a 800 Mhz converter for about
$100. Both handheld and base models. It goes inbetween the antenna and
antenna jack. I runs off 9v dc & ac. When switched on, it converts the
800 Mhz band down to the 400 Mhz band. CRB has other neat stuff too.
Hope this is usefull.

As a long time member of RCMA, I would like to help in this sad situation. Does anyone know if it would be possible to let Carol Ruth or John Clark or the other RCMA officers know they can keep my renewal refund? I just paid my renewal in May, and would like to donate it to the cause if possible instead of receiving a refund.

While my money won't make a difference in itself, if enough members did the same, it may make a small dent in the problem, and perhaps allow an earlier resumption of publication of our beloved Journal.

Source record: 230695

Well, now. Has anyone else had any power problems with their
OptoElectronics Scout 40? After 9 months of flawless charging cycles (deep
cycle) and operation, it just up and died today. One longer than usual
tone and -- poof. Doesn't charge. Doesn't take AC. The manual says that if
the LED doesn't come on for charging, which it doesn't, then a "fault
condition" has occurred, but, of course, makes no further mention of it.
Power has been reapplied and reapplied without effect; charging has been
restarted several times, all to no discernable effect. Discussion?

Here in the Michigan area, the "old" frequencies are still in use.
Typically by DPW, Road Crews, etc. In fact, from what I've heard, many
of them might be returning to the old frequencies due to the serious
short commings of the 800 MHz trunked systems! Fire ground crews for
instance are staying on the old frequencies.

John:

There are new FCC rules regarding aircraft communications equipment.
They have changed the spec for frequency tolerances, and doubled the
number of channels in the band. So I think your transceiver may be
limited to monitoring purposes only.

Hello to one and all.

Lookin' for freaquencies.

I am planning a trip from California to Louisiana. I'll be taking
I-40 across Arizona, New Mexico, and part of Texas, but around
Amirillo I will be dropping down the 287 to the Dallas-Fort Worth
area. From there I will take the I-20 into Louisiana.

Anywhay, I am resonably sure that most of you could care less about
this (I know I am only a small step above that myself), but I would
like to pick your colective brains. I am interested primarily in the
Highway Patrol, Department of Safety, and Sheriff freaquencies along
this route. But anything else of interest would be appreciated.

Thanks in advance.

>I was just wondering if this is a government law or something else. I
>live in Canada.

Huh? I live in Canada and have the same model. The list at the
beginning of the manual, shows these bands:

29-29.7 (10 Meter ham)
29.7-30 (HF Hi)
30-50 (VHF Lo)
50-54 (6 Meter ham)
108-136.975 (Aircraft)
137-144 (Goverment)
144-148 (2 Meter ham)
148-174 (VHF Hi)
406-450 (70 cm Ham and Goverment)
450-470 (UHF Lo)
470-512 (UHF "T" Band)
806-823.9375 (Public Service)
851-868.9375 (UHF Hi)
896.1125-956 (UHF Hi, 33 cm Ham)

You might have to reset the scanner. With the scanner off, press and
hold down the 2 and 9 keys, then turn on the scanner. Word of
warning, this WILL erase any freqs. you have stored in the memory
banks.

Hello Shortwave and Scanning Enthusiasts,

The IRC (EF-net) is a great place to trade frequencies, equipment advise, and just plain knowledge. For Shortwave DX and utility monitoring, it's great...people all over the world can monitor at the same time and report conditions and active frequencies.

I would like to start a new channel in addition to a few existing ones.
The new channel is called: #Monitor

Some existing channels for shortwave and scanning are:
#wun Utility HF
#ukscanner Scanning VHF/UHF in the UK
#shortwave inactive channel for broad shortwave interests

So.... Visit IRC channel #Monitor
73's

I have heard a couple of stories from people who were watching Washington State Patrol troopers engaged in radar or aircraft speed enforcement and were contacted by the troopers. The officers were REALLY interested in what CB/scanner/ham freqs were in the various radios, and were very concerned that some citizen was watching them stop violators.

Probably thought they were being video taped for the next "Rodney King" show.

Has anyone else had this happen to them in Washington?

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1996 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation, (317)326-4419, is
able to effect repairs on some older (pre-Uniden) Bearcat
scanners. They sell crystals, antennas, power cords,
owner's manuals ($11 ea). Electra Corporation is located

at 251 N. 300 W. Greenfield, IN 46140-8496.

Some schematic diagrams may be obtained from Uniden/Bearcat's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges. The phone number for repair is also (800)297-1023.

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from

"on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

HAMFEST/COMPUTERFEST CALENDAR 1996 - NORTHERN ILLINOIS
last updated June 24, 1996 |

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (708)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale and ARRL for providing some of the information.

JUNE

June 2 (Sun), Princeton, IL - Starved Rock RC. Bureau County Fairgrounds. Admission $5, free parking. Info: Debbie Burton, N9DRU, 1153 Union St., Marseilles, IL 61341-1710, tel. 815-795-2201 Usually an excellent hamfest, with sellers from Illinois, Iowa, and Wisconsin.

June 9 (Sun), Granite City, IL - Egyptianfest '96, Egyptian Radio Club. Granite City campus of Belleville Area College, 1/2 mile south of I-270 on Ill Hy 203 at Maryville Road. 8:00am to 1:00pm CDT. Annual hamfest, computer fair and fleamarket. VE session, food and drink, indoor dealer / exhibitor area. Talk-in 146.79 MHz. Info: Egyptian Radio Club, P.O. box 562, Granite City, IL 62040, call Bill Dusenbery N9OQK at (618) 398-1456.

June 30 (Sun), Wheaton, IL - Six Meter Club of Chicago. DuPage County Fairgrounds. Outdoor and indoor flea markets. Gates open 7 AM. Buildings open 8 AM. Admission $5 at gate. Talk-in on 146.97 MHz (107.2 PL) or 146.52 MHz. No booze allowed. Tickets available from Mike Corbett, K9ENZ, 606 So. Fenton Ave, Romeoville IL 60446. 24 hour hotline for info (708) 442-4961. Good hamfest which moved from Santa Fe Speedway to Wheaton this year.

Jun 30 (Sun) - Computer Central, College of DuPage (see notes at the end of this article).

JULY

Jul 13 (Sat), Oak Creek, WI - S. Milwaukee ARC Swapfest. American Legion Post 434, Shepard Ave. Admission $5. Talk-in 146.52 MHz. Info (414)762-3235.

Jul 14 (Sun), Sugar Grove, IL - Fox River Radio League. Waubonsee Community College, Rt. 47 at Harter Rd. VEC test-

ing. Admission $5 at gate, free parking. Info: Diana WD9API, (708)293-7485. Fair, small to mid-sized hamfest.

Jul 27 (Sat), Pecatonic, IL - Rockford ARA Hamfest. Winnebago County Fairgrounds. VEC testing at 1st Baptist Church, 7th & Washington. Admission $5. Kids 10 and under free. Info, Marsha Plasters (815)399-9233 or Diana White (815)645-8545.

Jul 28 (Sun) - Computer Central, College of DuPage (see notes at the end of this article).

AUGUST

August 4 (Sunday) - Peotone, IL - Hamfesters Radio Club 62nd | annual Hamfest and Computer Festival. Will County Fair- | grounds, Peotone, IL I-57 Exit 327 East 6a.m. - 3 p.m. Air | conditioned main exhibition hall opens 8 a.m. Lots of | covered flea marked space, acres of free parking. Grand | prize $500, 2nd Prize $300, $100 for 3rd Advance double-stub | tickets $4.00, $5.00 at gate for more info e-mail Jim Riley | KB9CYL at rileytrix@aol.com

August 10 (Saturday) - Western Illinois ARC Swapfest, Quincy, IL. Eagles Alps Grounds 3737 North 5 th Street. 4.5 miles north of downtown Quincy with easy access from US Highway 24. 8:00 a.m. to 2:00 p.m. Admission is $3.00 at the gate, $2.50 in advance, per person. ARRL VEC testing, all classes, is at 12:30 p.m. Reservations go to NA9Q at (217)224-8526. Indoor flea market is $5.00 per 5-ft table. Outdoor tailgating space is free. Talk-in is on 147.03. Lunch will be served on the grounds.

August 18 (Sun) - DuPage ARC, Stickney, IL. DuPage ARC Hamfest Computer Show. Hawthorne Race Course, 3500 S. Cicero Ave. Air conditioned exhibit hall for dealers. Outdoor fleamarket spaces free. 8AM - 2PM. 6 AM setup. Admission $5. Kids under 12 free. Talk in 145.25 MHz. Info: Ed Weinstein, WD9AYR, 7511 Walnut Ave., Woodridge, IL 60517. tel: 708-985-9256.

August 25 (Sun), Woodstock, IL - Tri-County Radio Group. McHenry County Fairgrounds, Rt. 47. Admission $5 at gate, free parking. Kids under 12 free. Info (voice/fax) (708)658-1678.

August 25 (Sun) - Vermilion County ARA, Danville, IL. Info: Gary Denison, KA9SKS, 14704 East 2750 North Rd., Danville, IL 61834-5610. tel: 217-759-7389.

August 28 - 30 - Antique Radio Club of Illinois, Elgin, IL. RadioFest96. Holiday Inn Holidome and Convention Center, 345 River Road, Elgin, IL 60123 Ph. (708)695-5000,

(847)695-5000 After 01/20/96. Info: Jeff Aulik, 1708 Parkview Ave., Rockford, IL 61107 or Carolyn Knipfel, RR 3, 200 Langhorn, Morton, IL 61550.

SEPTEMBER

September 8 (Sun) - Bolingbrook ARS, Joliet, IL. Info: Ed Weinstein, WD9AYR, 7511 Walnut Ave., Woodridge, IL 60517, tel: 708-759-7005

September 13-15 (Fri, Sat, Sun) - Peoria, IL. ARRL National Convention. Info: Ron Morgan, KB9NW, PO Box 3508, Peoria, IL 61612-3508, tel: 309-694-2649

Sep 21 & 22 (Sat & Sun), Grayslake, IL - Chicago FM Club Radio Expo. Lake County Fairgrounds. Starts 6 AM. Buildings open 8 AM. VEC testing. Info, (708)457-0966. Usually one of the best hamfests in NE IL.

Sep 29 (Sun) - Computer Central, College of DuPage (see notes at the end of this article).

NOTES - Computer Central shows

Computer Central computer shows are held at the College of DuPAGE, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 708-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

I am often asked, "How do you find these frequencies?" Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books

The most convenient source of fire and police frequencies is the Police Call, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $13. Police Call is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. Later editions have included a few pages of local airport and nonsensitive federal government frequencies. The 1996 edition contains selected business frequencies, too, but callsigns are listed only for local government and public safety licensees.

I highly recommend Richard Barnett's 1992 book, Monitor America, published by Scanner Master Corp. A 3rd edition is expected soon and will be available from Grove Enterprises for about $30. This second edition is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from

members of the world's largest scanning club, the Radio Communications Monitoring Association (RCMA). Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring

Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. In the 1995 edition, fields are different than PerCon's Spectrum CDROM. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across

the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (708)554-3839 6-10 PM central time. For a brochure, send SASE.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. The RCMA Scanner Journal is no longer being | published. The RCMA electronic mail address is RCMAHQ@GEnie.com.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access

door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap

tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new

information.

group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
60 old and new scanner radios and monitor receivers. Other
topics include:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other
radio hobbyists. This article describes a few of the FM
receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Grove Enterprises (Brasstown, NC) and Radio Shack repair scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both

tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 , Bearcat BC-101 , and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews of these scanner models
in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004
Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037

Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Feb 1996 - Radio Shack PRO-2042
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jul 1996 - Uniden/Bearcat BCT-10 mobile

Note: Reprints of Monitoring Times articles are available for $2.00 each (plus self addressed stamped envelope) from Grove Enterprises, PO Box 98, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this $2.00.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

ICOM

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of

Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal

lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. See "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC230XLT (Uniden): See BC220XLT.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the

part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none.

Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout

Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility

indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a transmission.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay

is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-26: 1985 vintage. Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring

parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-62: 1984 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal

case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2526	10	X		yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (708)554-3839 6-10 PM central time. For a brochure, send SASE.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1996 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35 33K	replace with 220K. Located between pins 12 and 14 of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K	try 220K.
Radio Shack PRO-2004	R148 47K	remove R148 or replace with 220K.

	On linear board,
	between pins 12 & 14
	of TK10420 (IC2)
Radio Shack PRO-2022	R91 33K replace 33K
	with 220K.
	Between pins 12 & 14
	on IC-1 MC3361
Radio Shack PRO-2035	100K replace 100K
	with 220K.
	Between pins 12 & 14
	of TK10420 (IC-2)
Electra/Bearcat 220	R75 2.7M may be ok as is
Electra/Bearcat 20/20	R75 2.7M may be ok as is

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

This introduction is intended for people new to the scanning hobby and is oriented to scanning in the USA. It tells where you can buy your first scanner, what features it should have, where to get it repaired if required, how to get frequency information, and mentions a few scanner clubs worth joining.

The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, airplanes, armored cars, trains, taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air

Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-62 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer to replace the stock antenna with an Icom FA-1433B dual band flex antenna which is thin and very flexible while providing better performance than a stock antenna.

Although it is small and somewhat tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Since 1988, I've used the "Thin-Stick" 18 inch telescoping antenna for extended range on my portable scanners and 2 meter walkie-talkies. The Thin-Stick, made in USA by Smiley Antenna Co., Inc., is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and

the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove.net

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

If you cannot find files describing modifications to a particular scanner, it's probably because nobody bothered to devise a modification, or more likely, nobody has taken the time to document their modification.

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then

copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The 1996 editions contain selected business listings, too, although callsigns are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing),

and available from Grove Enterprises for about $30. A new, 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information

Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the

locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.
